Murphy's Law
Safe upgrade
of embedded systems

Arnout Vandecappelle
http://mind.be/content/Presentation_Safe-Upgrade.pdf or .odp

1 Failure mechanisms

- Power failure
- Bad firmware
- Flash corruption
- Communication errors

2 Boot loader upgrade

3 Package-based upgrade

Power fails *during* upgrade

⇒ new firmware only partially written

Solutions:

❏ Add *fail-safe* firmware

❏ *Detect* failed power

❏ *Atomic* update of firmware images

❏ Use journalling filesystem
for writable data

1. Boot current firmware
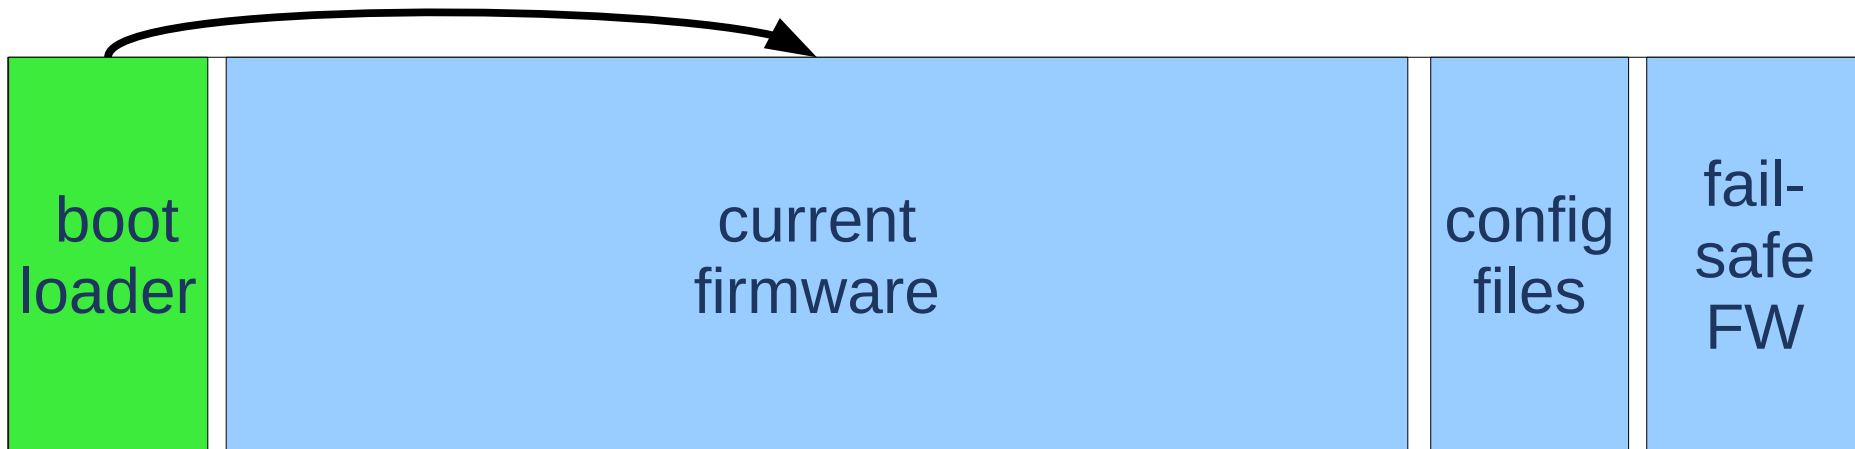

boot loader	current firmware	config files	fail-safe FW

2. Switch to fail-safe

boot loader	current firmware	config files	fail-safe FW

| boot loader | | new firmware | config files | fail-safe FW |
3. Overwrite firmware
4. Fail-safe restarts upgrade

boot loader	new firmware	config files	fail-safe FW

5. back to new firmware

boot loader	new firmware	config files	fail-safe FW
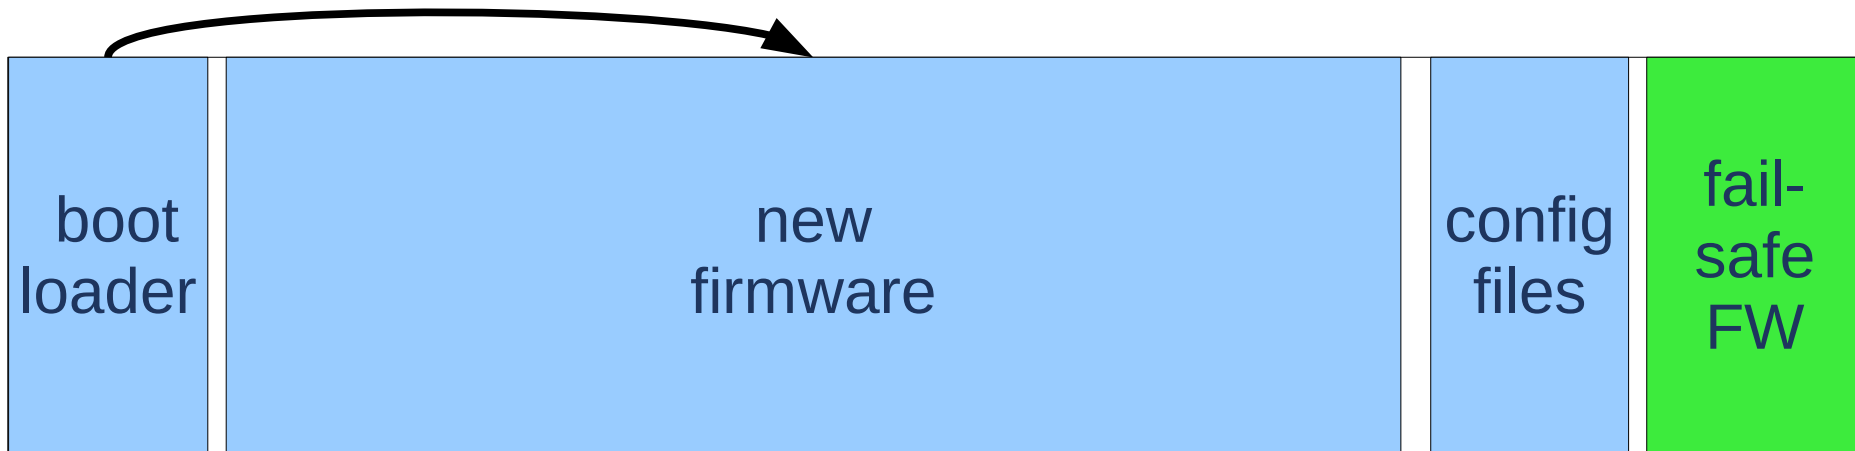

❑ Grub, extlinux

Overwrite a file

⇒ Make sure overwrite is atomic, using rename(2)

⇒ Relies on atomicity of underlying
filesystem implementation
e.g. ext4: mount with `barrier=1`

❑ U-Boot

Overwrite environment

⇒ Catastrophic if power fails during environment write

❑ Use CRC to validate new image

check CRC   fallback

| boot loader | new firmware | config files | fail-safe FW |

check CRC   fallback

| boot loader | new firmware | config files | fail-safe FW |
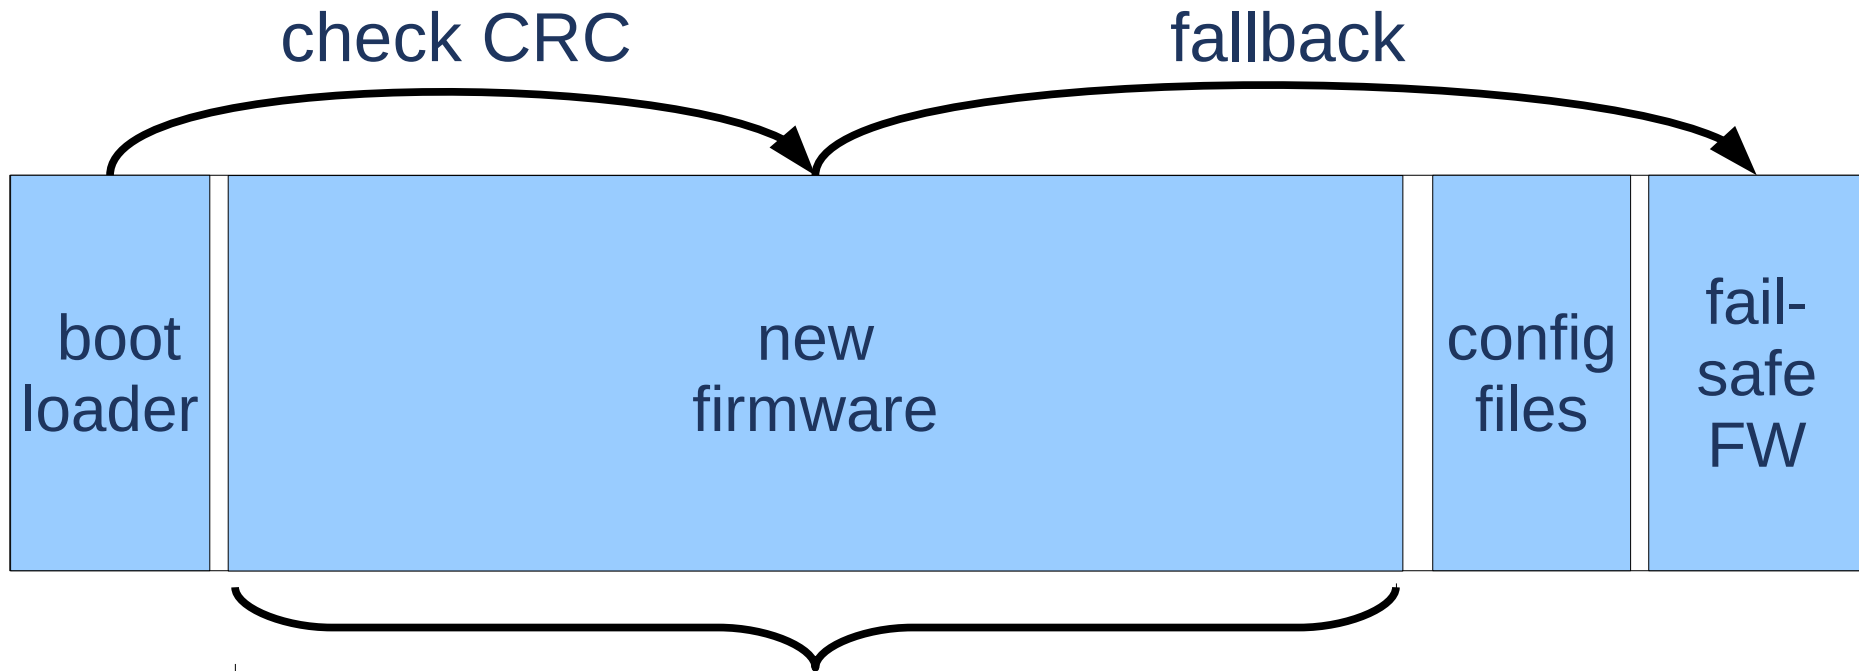

60MB ⇒ several minutes to check
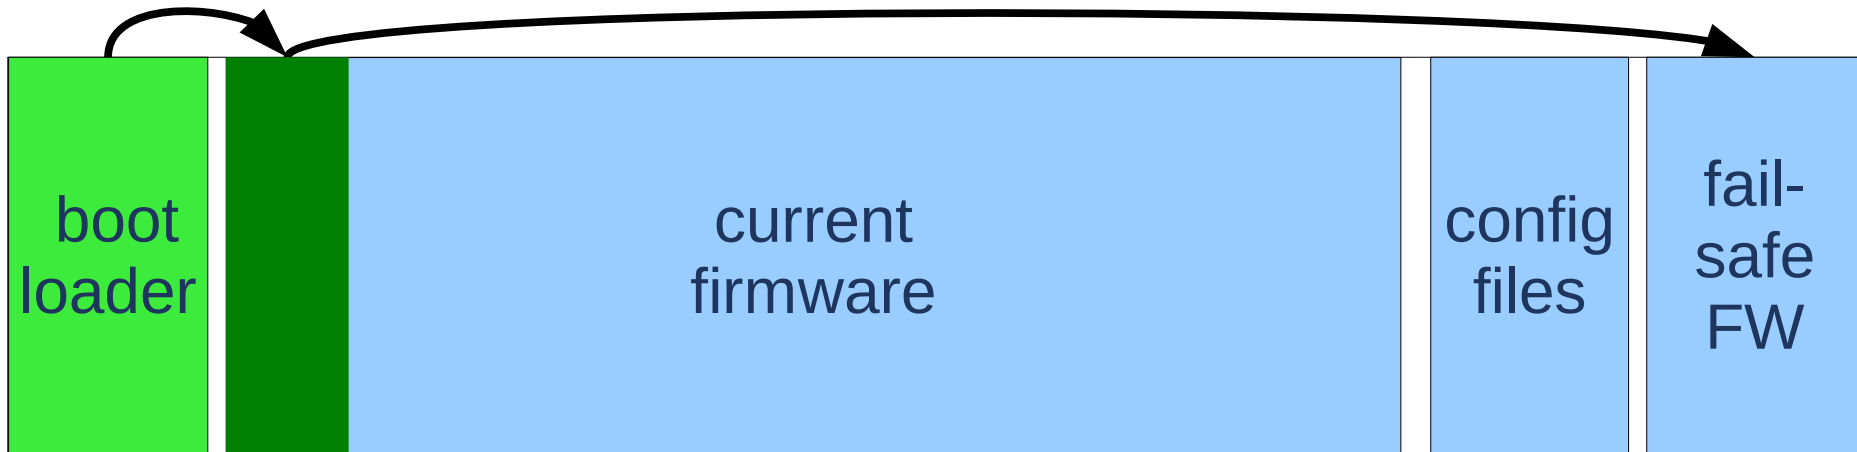

check CRC

fallback

| boot loader | | current firmware | config files | fail-safe FW |

check CRC   fallback

| boot loader | ✕ | current firmware | | config files | fail-safe FW |

check CRC

fallback

| boot loader | ✕ | | new firmware | config files | fail-safe FW |

boot loader		new firmware	config files	fail-safe FW
boot loader	**UBI**			fail-safe FW
part. 1	partition 2			part. 3
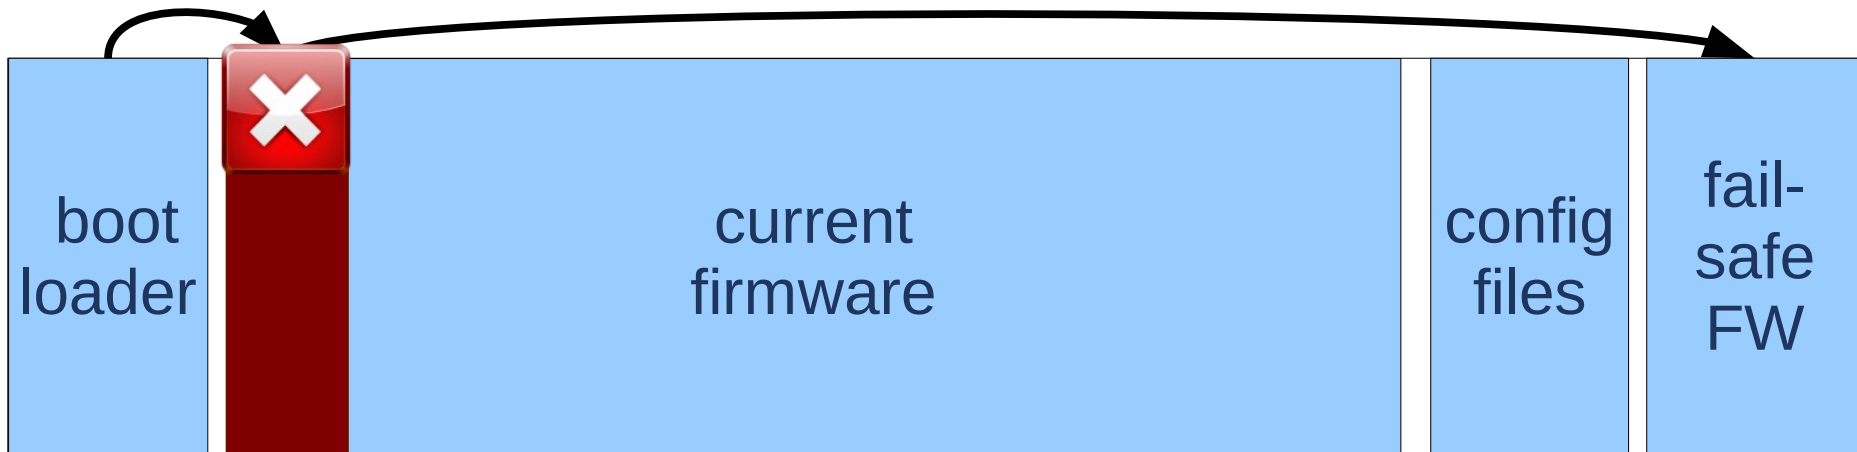

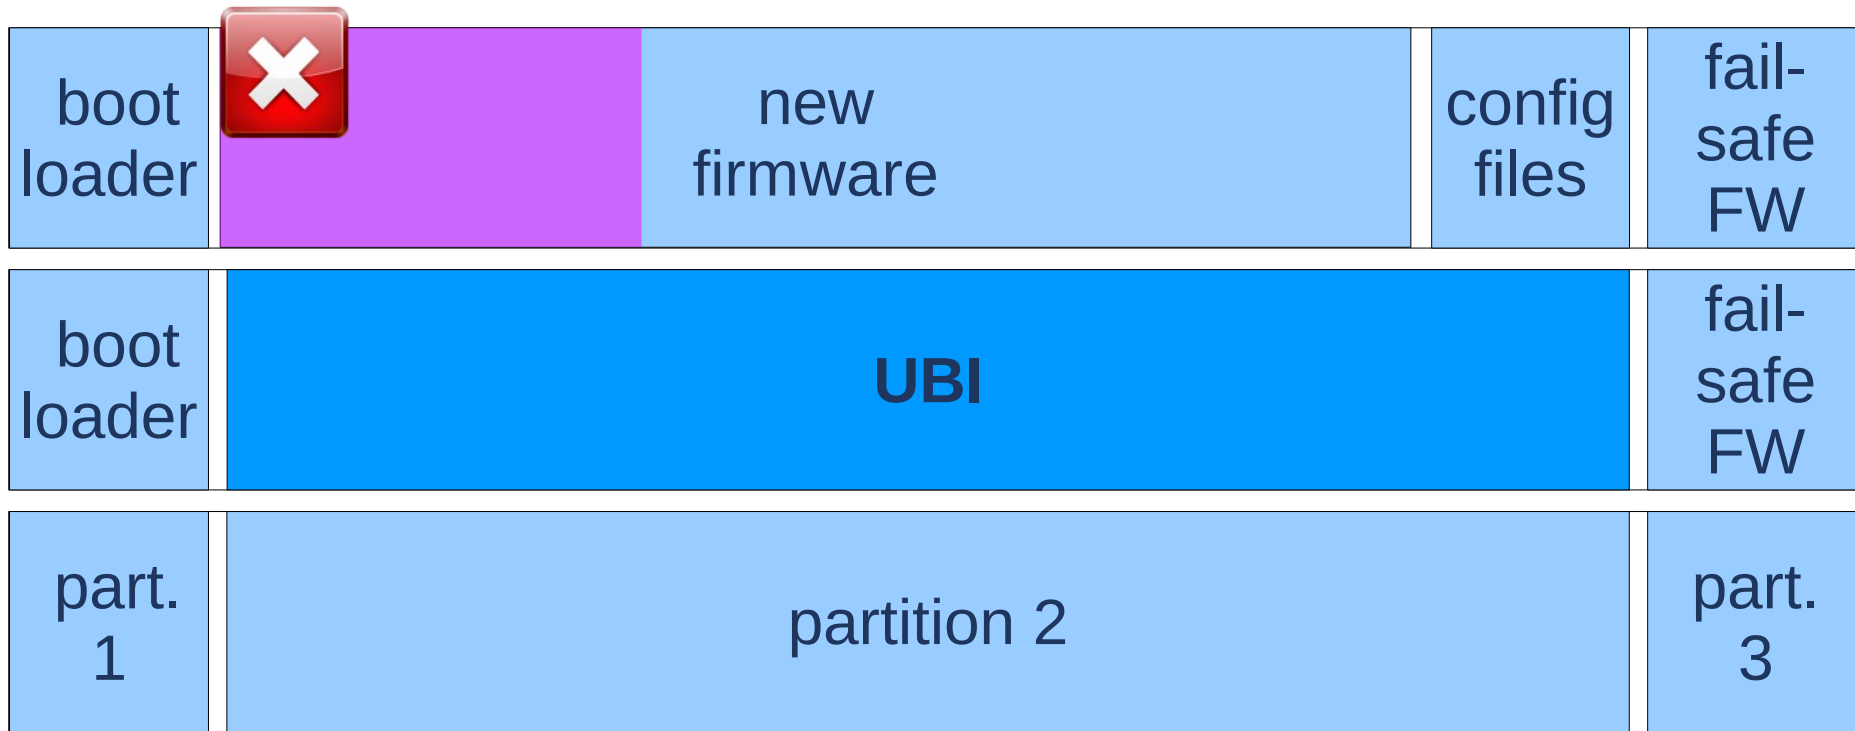

MTD device (NAND Flash)

New firmware fails on some devices

Solutions:

❑ Fall back on previous (known good) firmware

❑ Fail-safe firmware that can do upgrades

❑ Upgrade script included in upgrade image

❑ Watchdog reboot +
   boot fail-safe after bad boot

fallback   fallback

| boot loader | new firmware | known good firmware | config files | fail-safe FW |

watchdog

boot loader	new firmware	known good firmware	config files	fail-safe FW

boot loader	new firmware	known good firmware	config files	fail-safe FW
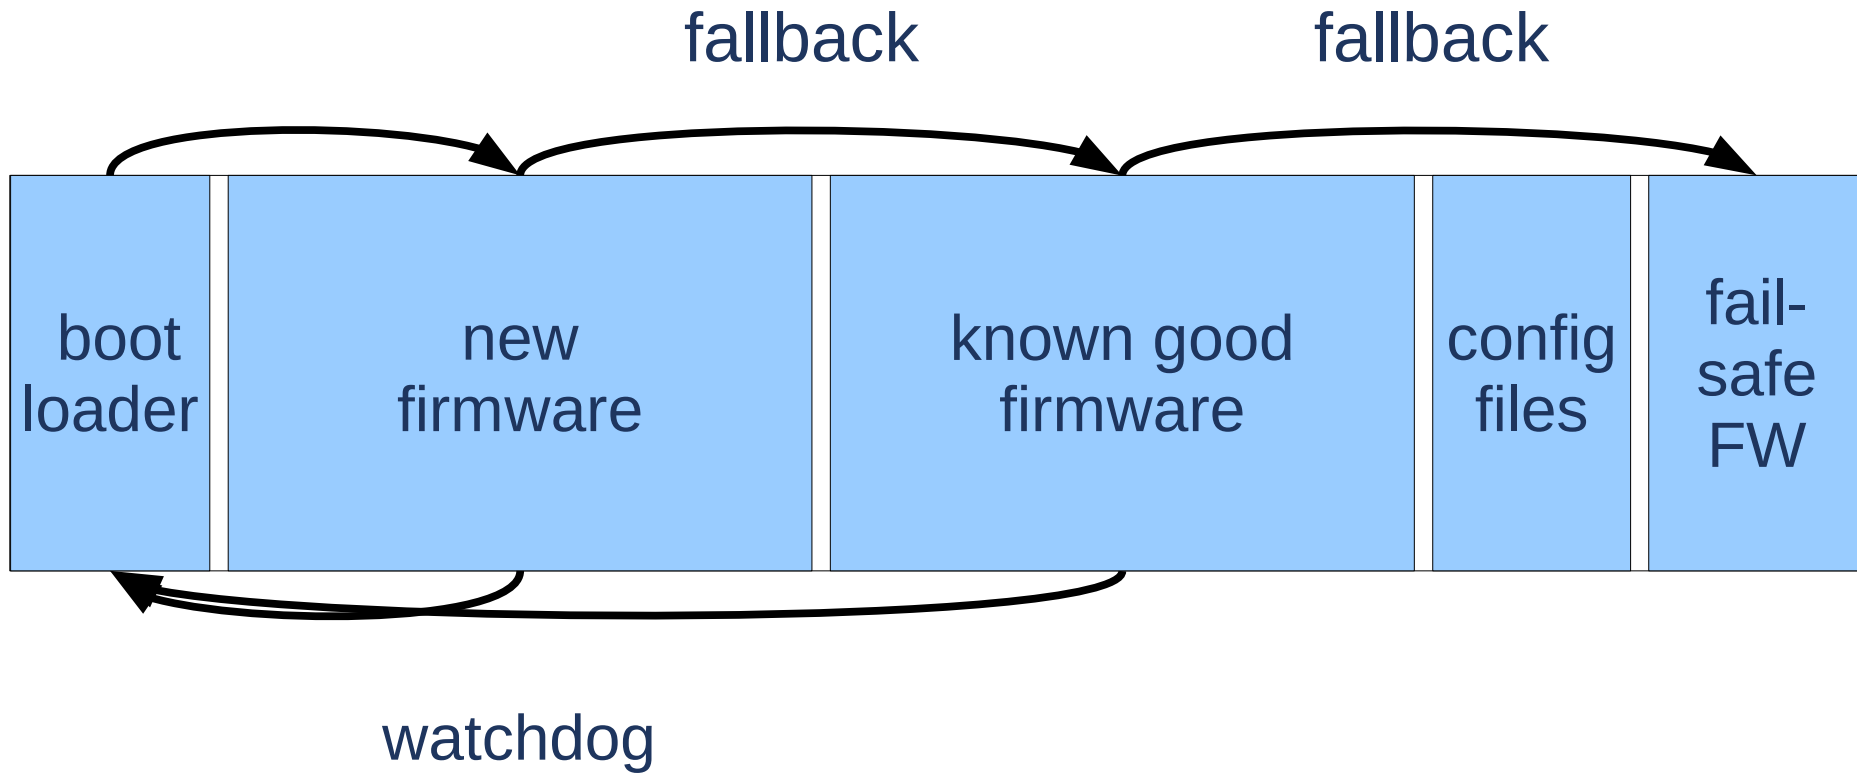

Reboot when watchdog timer expires
Reset watchdog if firmware runs well
Force reboot if firmware does not run well

1 Failure mechanisms

- Bad firmware
- Power failure
- **Flash corruption**
- Communication errors

2 Boot loader upgrade

3 Package-based upgrade

Flash storage is **unreliable**:
each individual bit becomes unusable after N writes

❑ Error correcting codes (ECC):
detect & correct bit errors
when reading

❑ Wear levelling:
don't reuse the same block all the time

❑ Bad blocks:
stop using a block if too many errors

Flash **filesystem** must handle these problems

UBI provides safe NAND writing
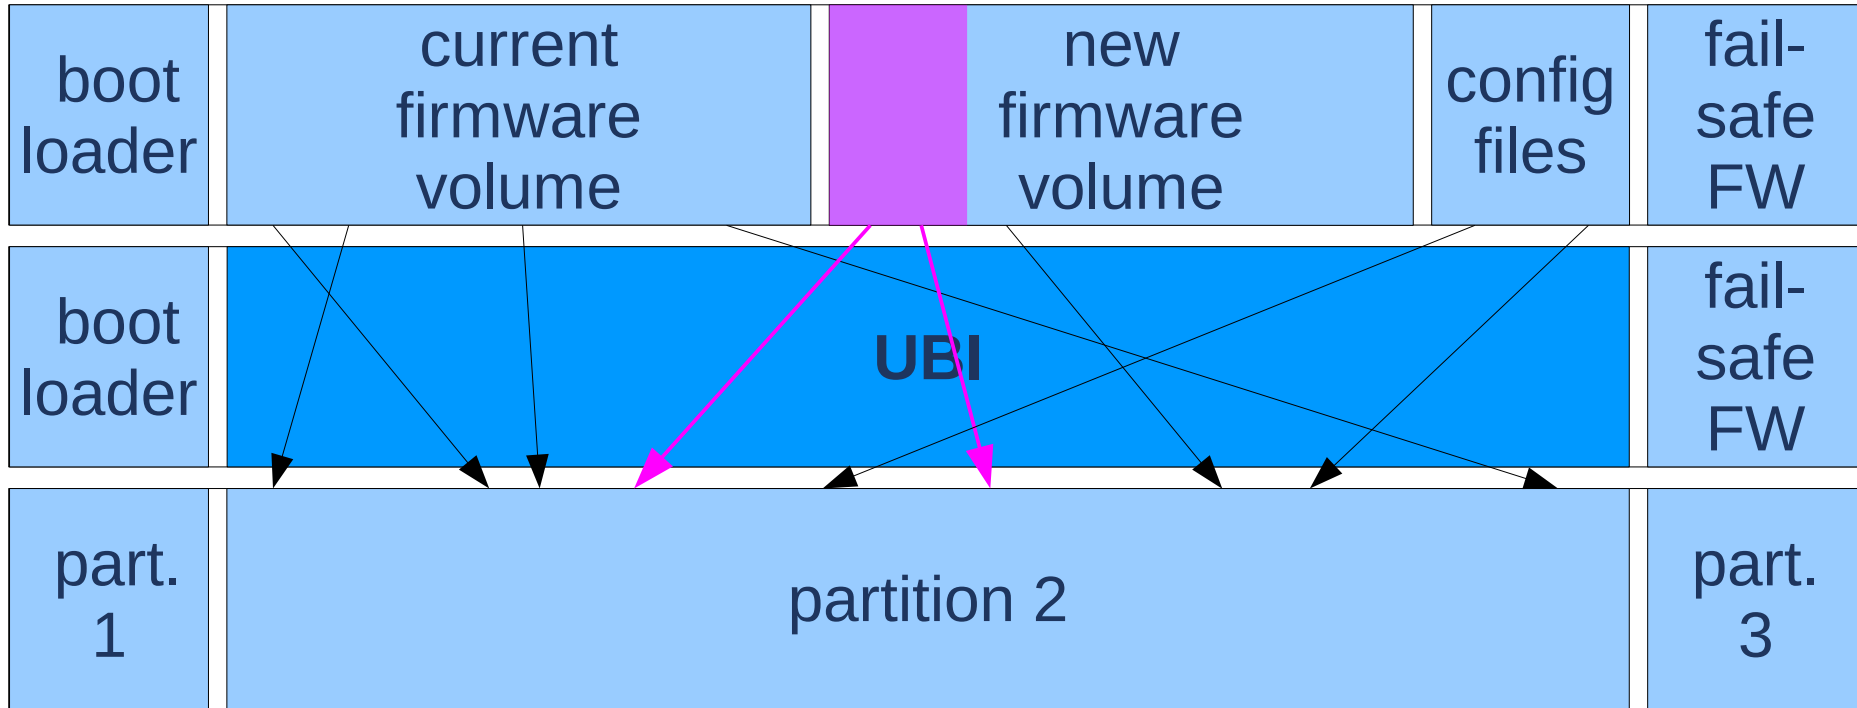

boot loader | current firmware volume | previous firmware volume | config files | fail-safe FW

boot loader | **UBI** | fail-safe FW

part. 1 | partition 2 | part. 3

MTD device (NAND Flash)

MTD device (NAND Flash)

boot loader	current firmware kernel + initramfs	new firmware kernel + initramfs	config files	fail-safe FW

part. 1	partition 2 (ext4fs)	part. 3

SD card controller

NAND bank 1	NAND bank 2

boot loader	current firmware kernel + initramfs	new firmware kernel + initramfs	config files	fail-safe FW

part. 1	partition 2 (ext4fs)	part. 3

SD card controller

NAND bank 1	NAND bank 2

See http://elinux.org/images/4/49/Elc2011_bergmann.pdf

Atomic rename at ext4fs level

boot loader	current firmware kernel + initramfs	new firmware kernel + initramfs	config files	fail-safe FW

part. 1	partition 2 (ext4fs)	part. 3

SD card controller

NAND bank 1	NAND bank 2

See http://elinux.org/images/4/49/Elc2011_bergmann.pdf

Atomic rename at ext4fs level

| boot loader | current firmware kernel + initramfs | new firmware kernel + initramfs | config files | fail-safe FW |

| part. 1 | partition 2 (ext4fs) | part. 3 |

No real control of what happens

SD card controller

| NAND bank 1 | NAND bank 2 |
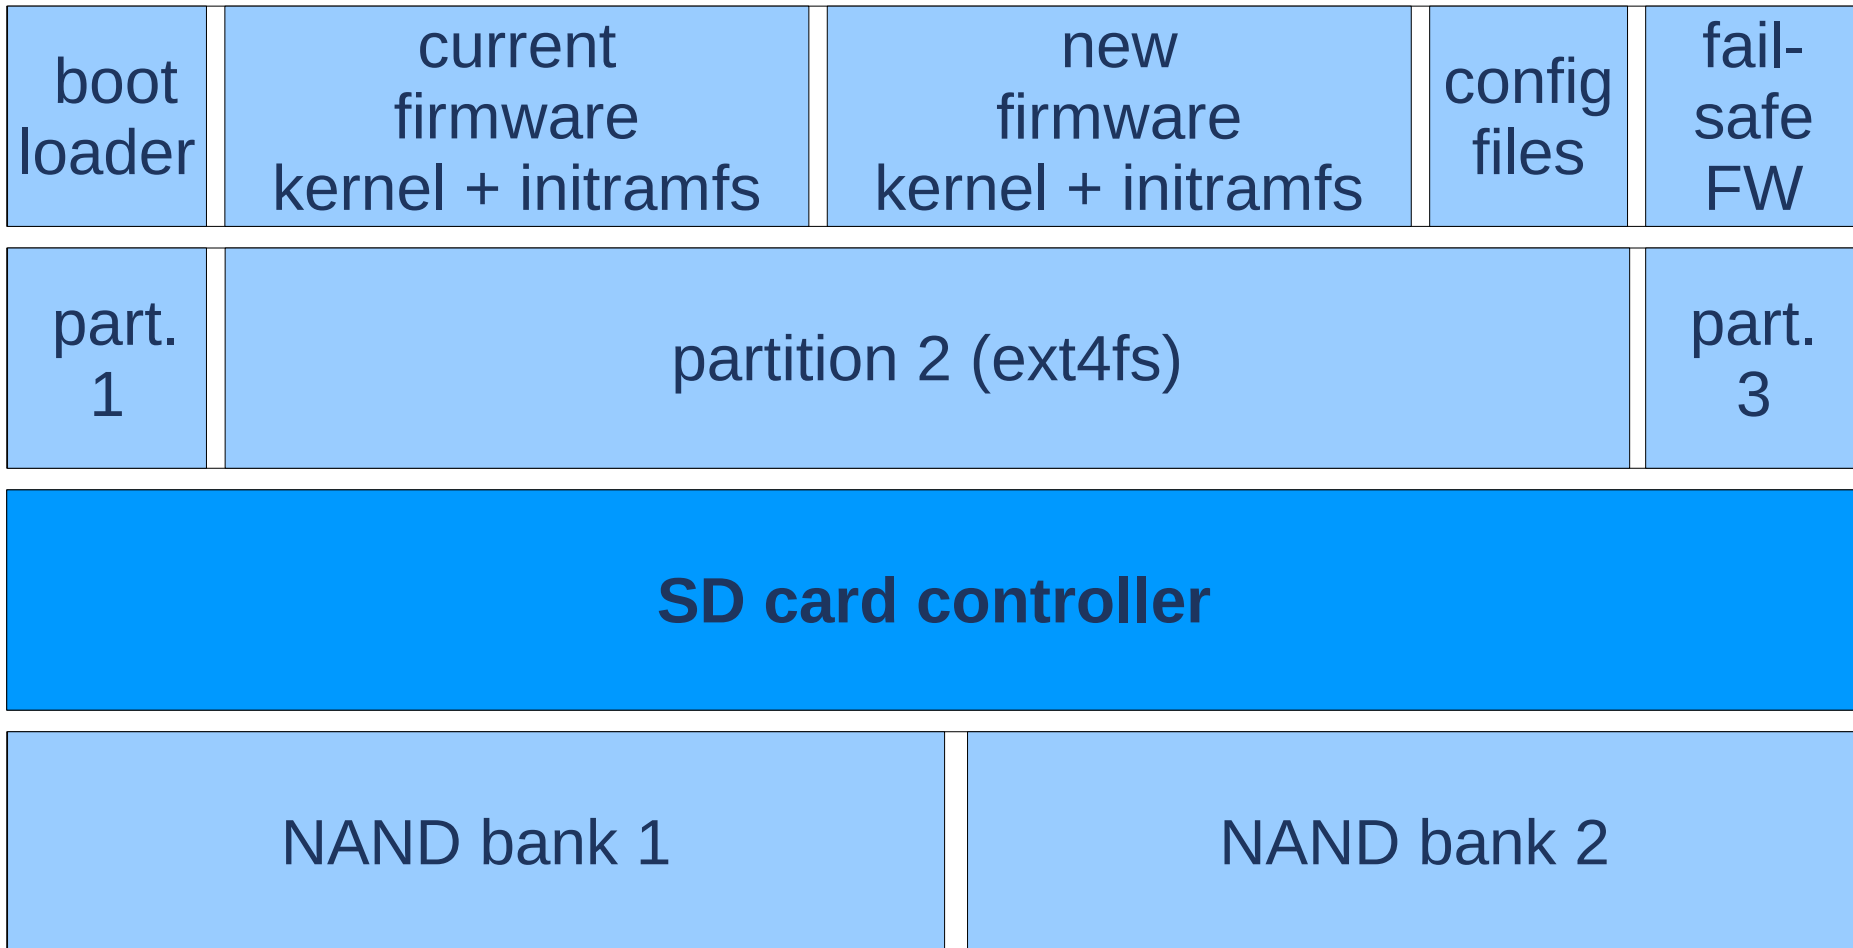

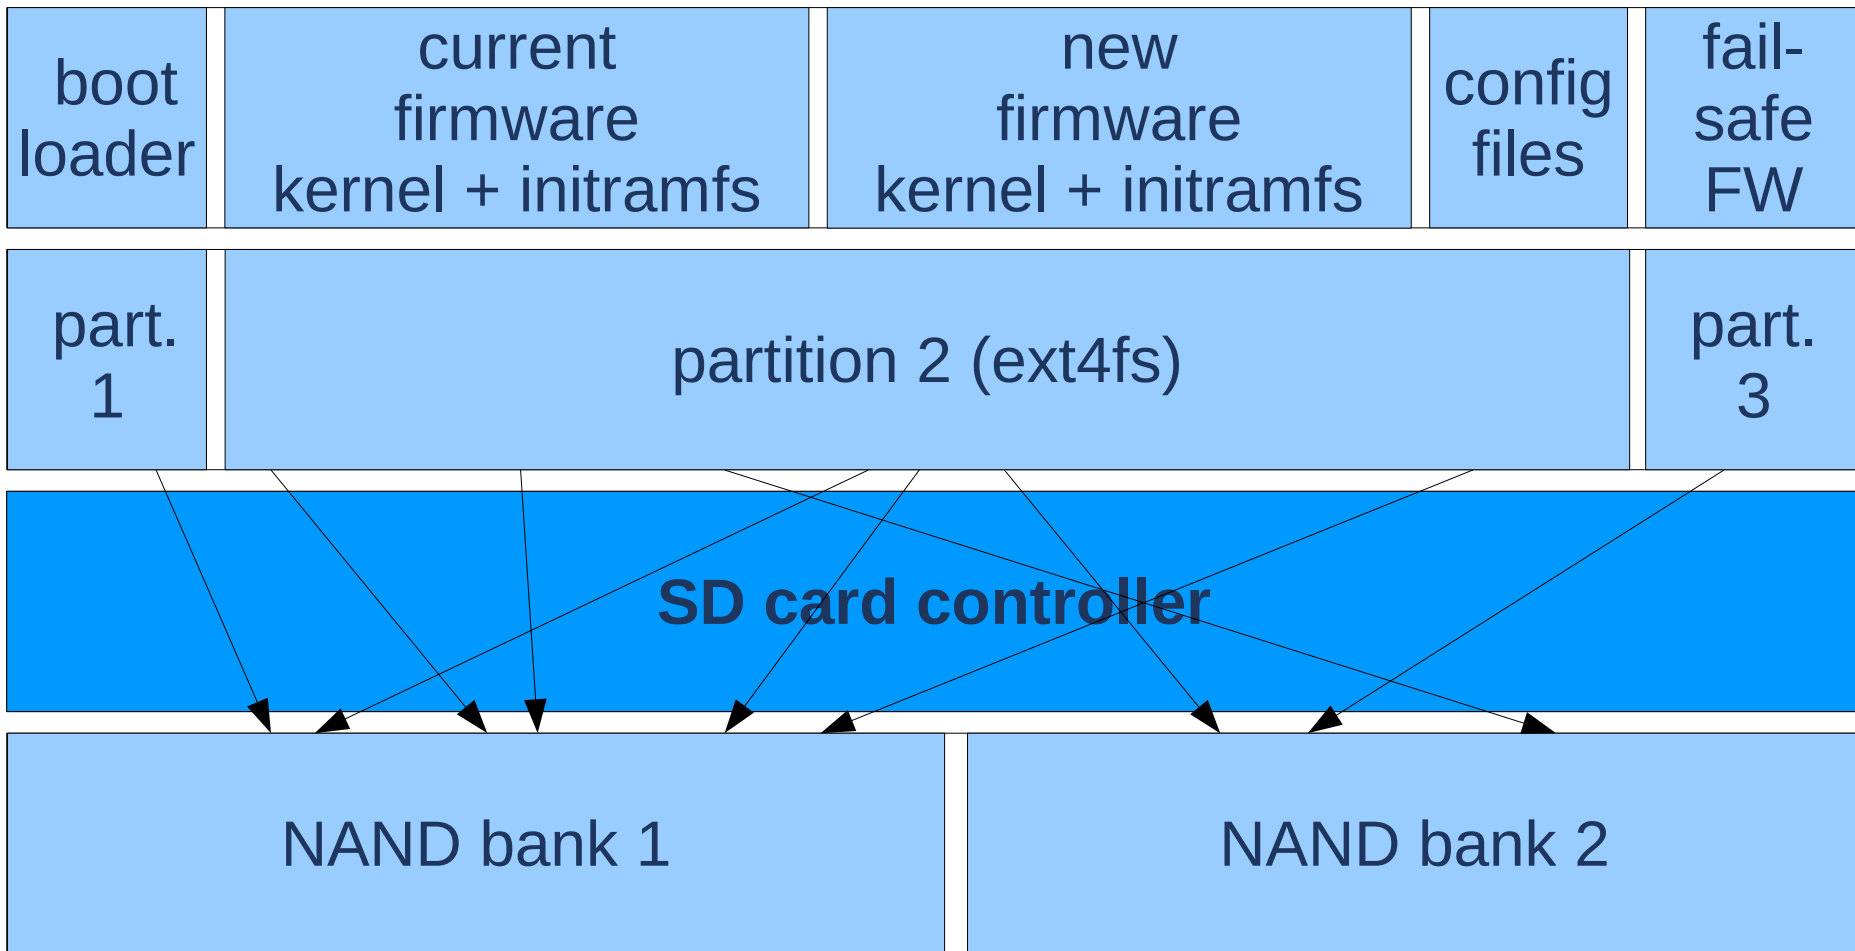

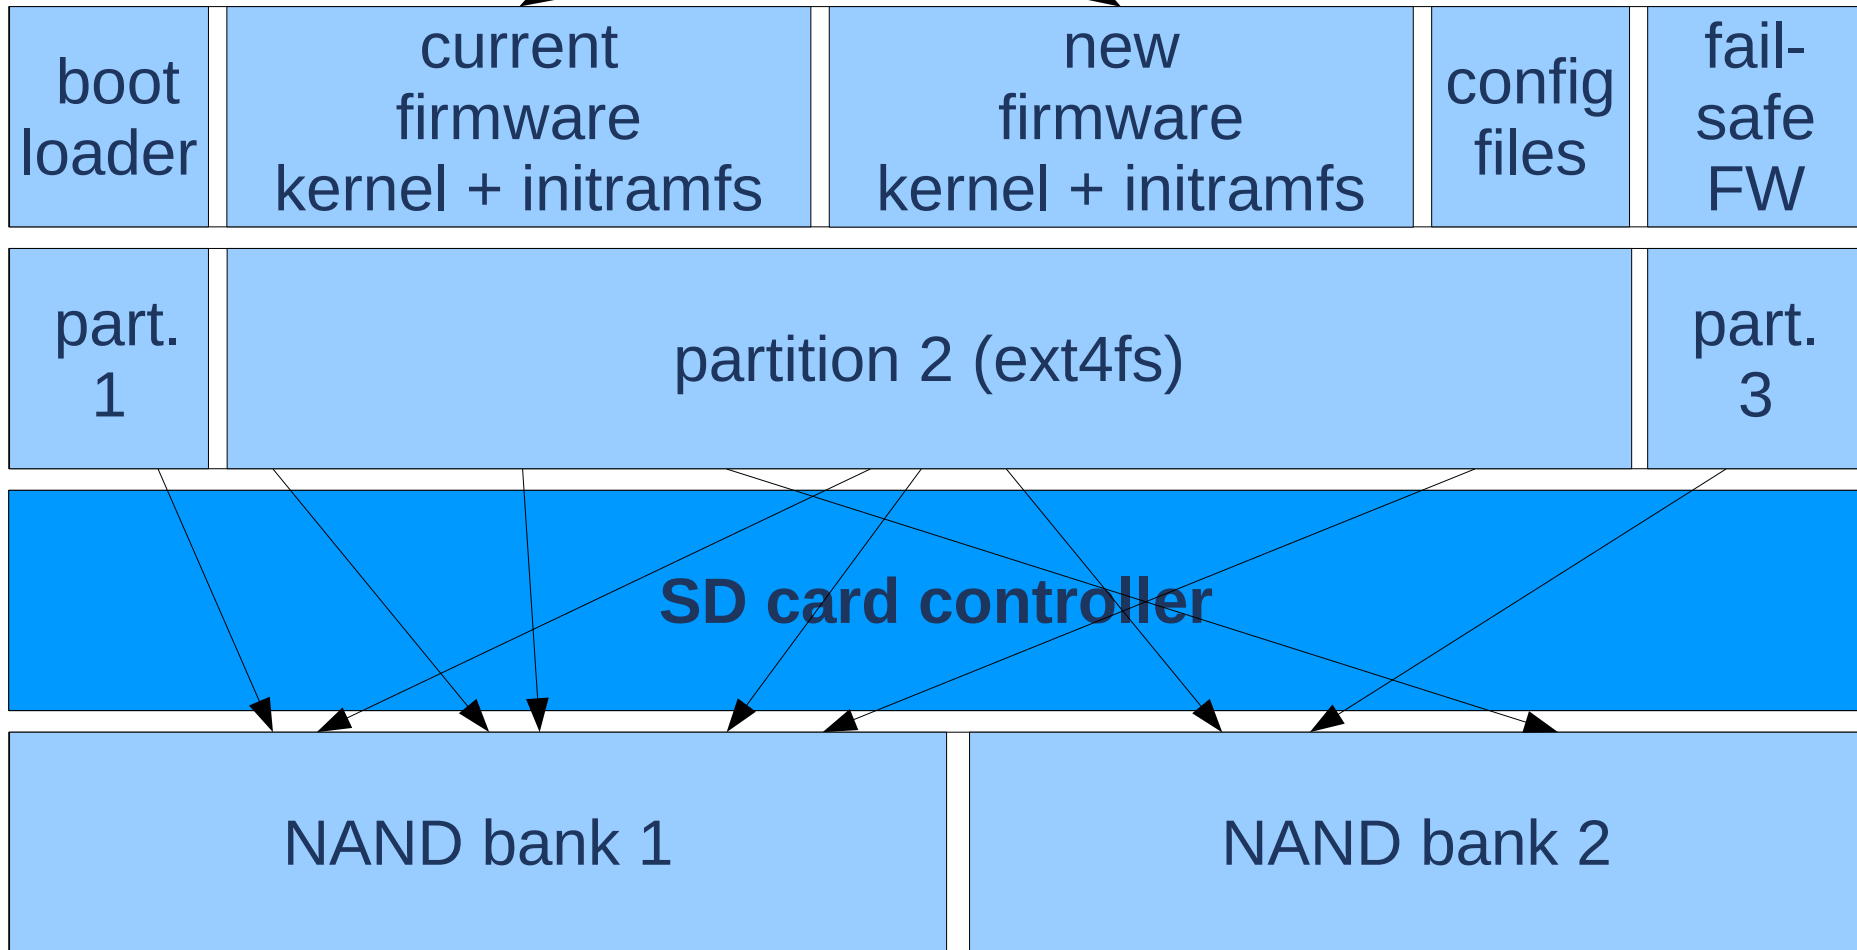

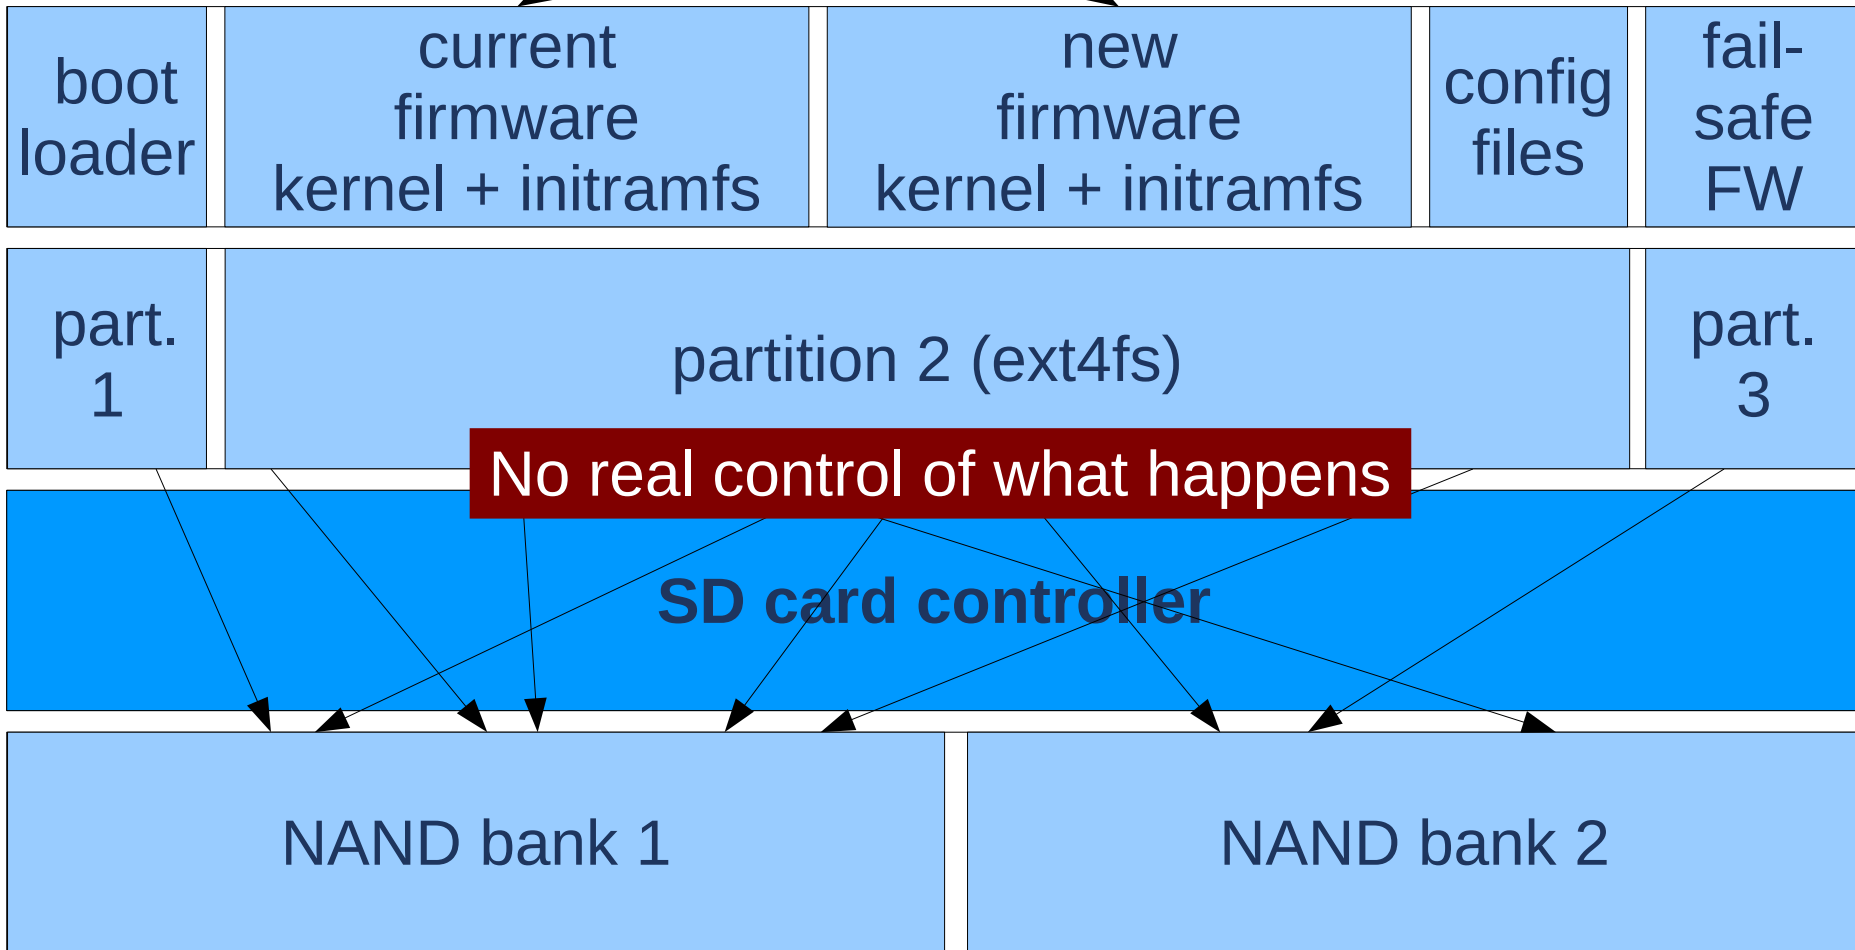

See http://elinux.org/images/4/49/Elc2011_bergmann.pdf

1 Failure mechanisms

- Bad firmware
- Power failure
- Flash corruption
- Communication errors

2 Boot loader upgrade

3 Package-based upgrade

private key
`gpg --sign <file>`

public key
`gpg < <file> > <out>`

- ❏ Make it possible to install new public keys

  - ◾ Signer key may expire
  - ◾ Give third parties possibility to create upgrades
  - ◾ Avoid tivoization

- ❏ Make it possible to install revocations

  - ◾ Signer key may be stolen

- ❏ Make new keys and revocations accessible to fail-safe

- ❏ If upgrade file doesn't fit in memory:

  - ◾ Split it in chunks
  - ◾ Add an index (to check integrity)

1 Failure mechanisms

- Bad firmware
- Power failure
- Flash corruption
- Communication errors

2 Boot loader upgrade

3 Package-based upgrade

If boot loader is broken

No recovery is possible

(unless a ROM boot loader comes first)

⇒ don't put bugs in the boot loader

⇒ don't put features in the boot loader

NAND Flash

new firmware

known good firmware

config files

ROM boot

1. Destroy old boot loader

Serial Flash

boot loader

fail-safe FW

NAND Flash

| boot loader | new firmware | known good firmware | config files |

ROM boot

Serial Flash

| boot loader | fail-safe FW |

1. Destroy old boot loader
2. Write new bootloader

NAND
Flash

| boot loader | new firmware | known good firmware | config files |

ROM boot

1. Destroy old boot loader
2. Write new bootloader
3. In case of failure, will boot from backup media

Serial
Flash

| boot loader | fail-safe FW |

NAND Flash

| boot loader | new firmware | known good firmware | config files |

ROM boot

Serial Flash

| boot loader | fail-safe FW |
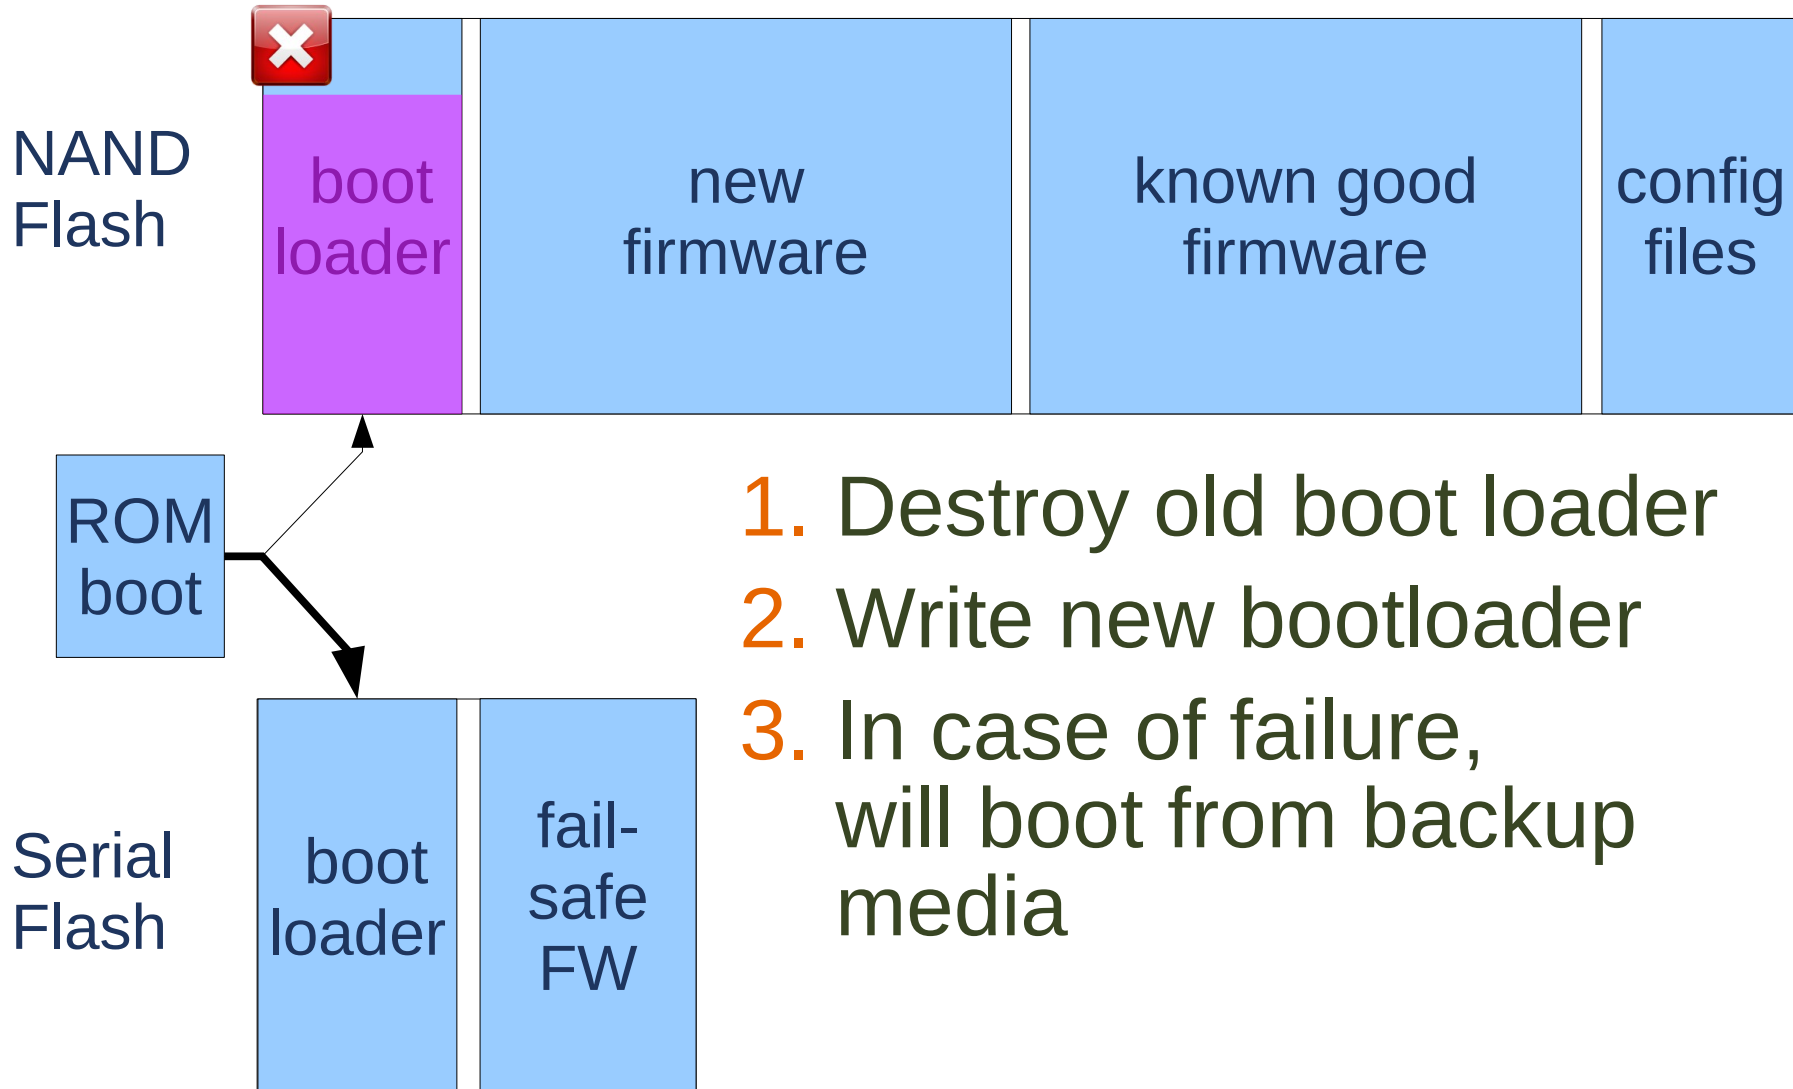

1. Destroy old boot loader
2. Write new boot loader
3. In case of failure, will boot from backup media
4. Write magic number, so new boot loader is

1 Failure mechanisms

- Bad firmware
- Power failure
- Flash corruption
- Communication errors

2 Boot loader upgrade

3 Package-based upgrade

Use a package manager (ipkg, opkg, dpkg, rpm) and upgrade individual packages

Advantage: smaller upgrade files

Disadvantages:

- Difficult to predict what is installed exactly
  ⇒ don't rely on version numbers,
     but use manifest with exact package versions
- More places where something can go wrong (Murphy)
- No package manager is truly atomic
  closest: http://nixos.org

1) Execute removal script

- Shut down daemon
- Remove some generated files

2) Remove old files

3) Upgrade dependencies

4) Install new files

5) Execute install script

- Create new users
- Create new directories
- Start daemon

PATH

- ❑ Take into account different failure mechanisms: bad firmware, power failure, communication failure, flash corruption

- ❑ No single ideal upgrade mechanism exists Some things really depend on the hardware

- ❑ No (open source) upgrade software exists

❑ Take into account different failure mechanisms: bad firmware, power failure, communication failure, flash corruption

❑ No single ideal upgrade mechanism exists Some things really depend on the hardware

❑ No (open source) upgrade software exists
