

LAVA FOR BISECTING KERNEL BUGS

LAVA MEETS GIT BISECT RUN

Created by [Riku Voipio](#) / [G+ RikuVoipio](#)

STARTING POINT

Someone broke the time, fix asap!

```
# cat test-rtc
date '+%F %T'
hwclock
# ./test-rtc
1970-01-01 00:00:51
hwclock: Cannot access the Hardware Clock via any known method.
hwclock: Use the --debug option to see the details of our search for an acces
```

GIT BISECT TO RESCUE

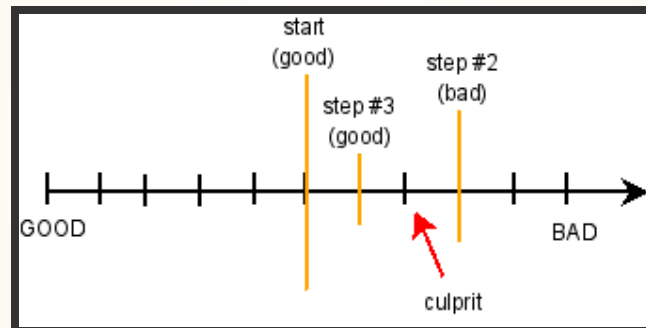

Start Git bisect by defining a range of commits to check

```
$ git bisect start <BAD> <GOOD>  
Bisecting: 109 revisions left to test after this (roughly 7 steps)  
[1570ebd3206c2f5e6ba7e42652312183cadb4511] s390/bpf: Fix offset parameter for
```

- <BAD> is first known broken commit/tag
- <GOOD> is last known working commit/tag
- The first commit to test has been checked out

GIT BISECT MANUALLY

- Test the commit and tell git if it was good or bad
- `git bisect bad` for failed tests
- `git bisect good` for success
- Bisect algorithm finds the culprit commit in $O(\log n)$ steps

GIT BISECT RUN

```
$ git bisect start badcommit goodcommit  
$ git bisect run ./compile-and-test  
running ./compile-and-test
```

Exit code of the compile-and-test script decides if a commit was good or bad.

LETS START DEMO

Start bisecting in the background

```
$ cat ./bisect
make O=build omap2plus_defconfig > /dev/null
make O=build/ zImage dtbs > /dev/null||exit 125
lava-boot -k build -d beaglebone-black -r test-rtc --quiet

$ git bisect start HEAD v3.19-rc5
voipio@beaming:~/linaro/linux$ git bisect start HEAD v3.19-rc5
Bisecting: 109 revisions left to test after this (roughly 7 steps)
[c87fbc6833c26d5e4fe261db4541ca1cedb3642] s390/bpf: Fix sk_load_byte_msh()
$ time git bisect run ./bisect
running ./bisect
```

Let the computer do the work and me do the talk - just in case:
pre-recorded demo.

LAVA

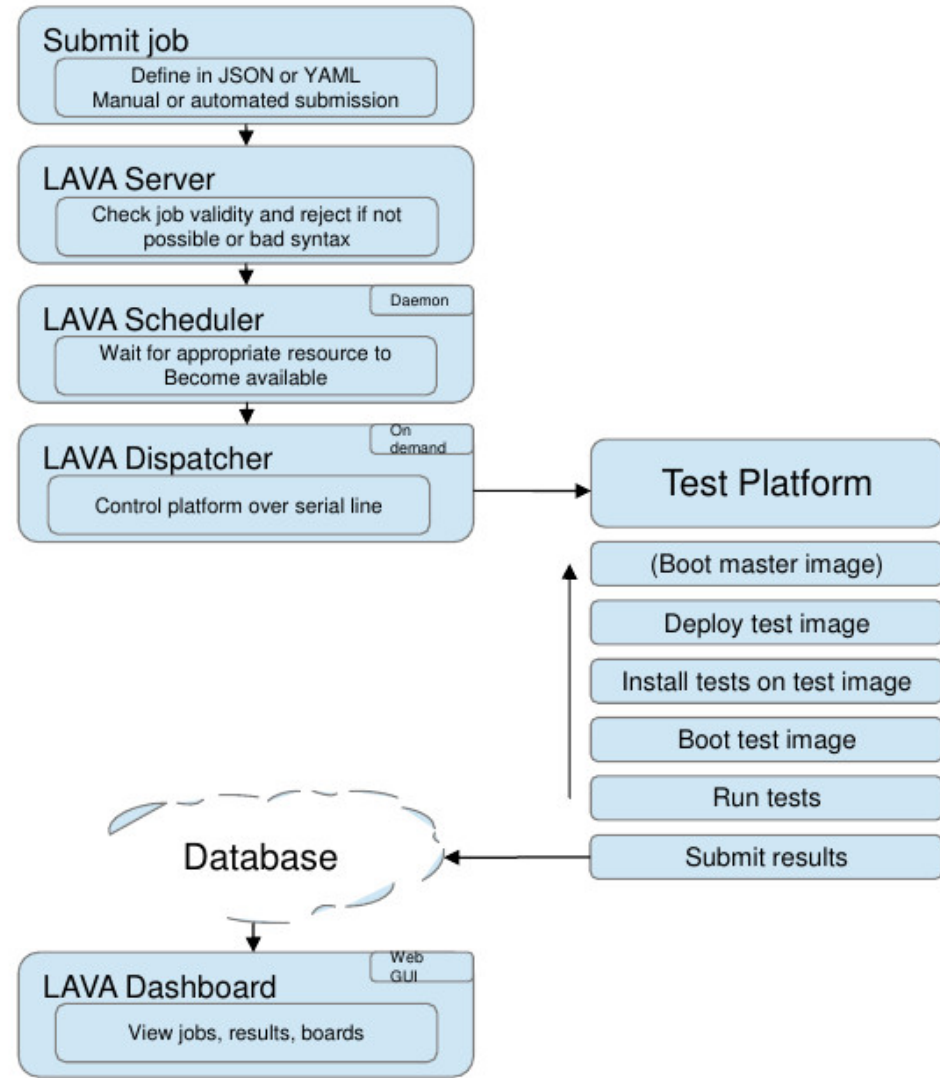

Linaro Automated Validation Architecture

- “Metal as a Service” for testing software on a range of devices
- Submit jobs for a device type and get results
- Requires `_serial_` access, network and power control
- Command line and web interface
- Available in Debian: `apt-get install lava`

LAVA DEMO ON THIS LAPTOP

- lava-server installed inside KVM
- KVM and eth0 bridged for NFS/TFTP
- Power control with USB relay
- Web interface live at <http://lava-server/>

LAVA

LAVA - POWER CONTROL

ebay "apc
masterswitch"
100€+

Ubiquiti
mpower
84€

Boxed
relays
38€

DYI relays 10€

Future: tailored for LAVA, **OpenTAC** BeagleBone cape providing power, ethernet, serial and more.

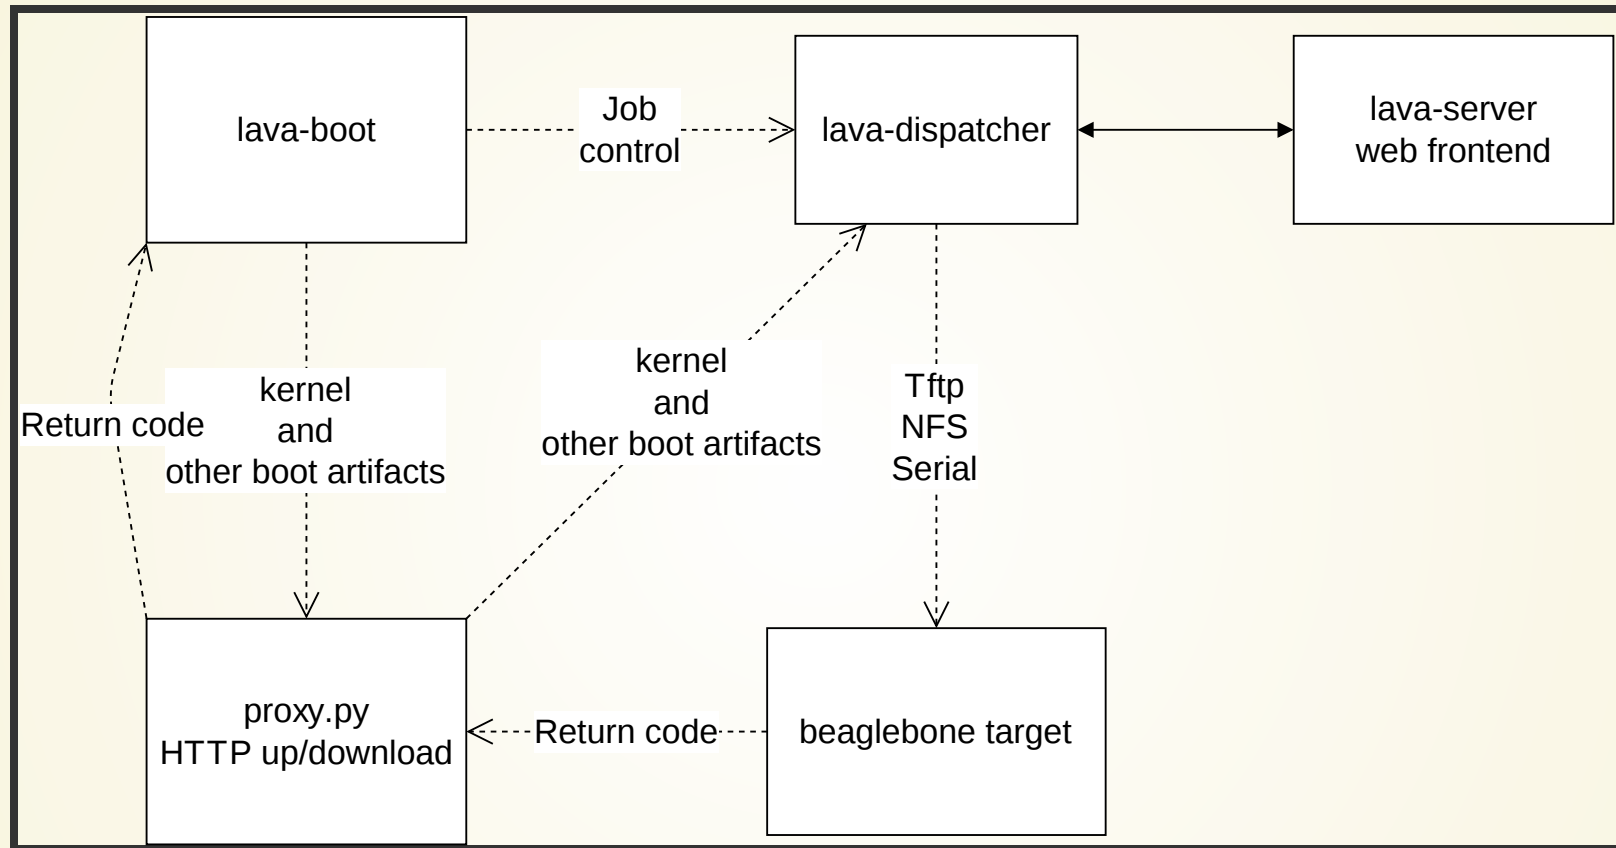

LAVA-TOOL

- Official LAVA command line tool
- Uses xml-rpc to lava-server
- Asynchronous - doesn't wait for job to finish
- Reads authentication token from gnome-keyring :(
- = Not really suitable for bisecting

LAVA-BOOT

- Complements lava-tool
- Synchronous - waits for job to finish and gives exit code
- Starts a small HTTP server for LAVA to fetch kernel, dtb etc
- Variable substitution and other lifesaving features
- Stores authentication token in config file

LAVA-BOOT GRAPH

LAVA AUTHENTICATION

To script LAVA, authentication token is needed.

Select API -> Authentication tokens

The image shows a web browser window with the URL `lava-server/api/tokens/`. A modal dialog box titled "Description of new token" is open. The dialog contains the following text: "The token description is arbitrary text which can help you to associate tokens with an intended purpose." Below this text is a text input field containing the word "fosdem". At the bottom of the dialog are two buttons: "Cancel" and "Create".

LAVA-BOOT SETTINGS

Settings stored in ~/lava.yaml

```
server: lava-server  
user: default  
token: kdu4rdd9i0daepsf...  
proxy-hostname: 192.168.2.10  
https: false
```

LAVA JOB DEFINITION

```
actions:
  - command: deploy_linaro_kernel
    parameters:
      dtb: '${PROXY}/${DTB}'
      kernel: '${PROXY}/${KERNEL}'
      nfsrootfs: '${ROOTFS}'
      target_type: ubuntu
  - command: boot_linaro_image
  - command: lava_test_shell
    parameters:
      testdef_urls:
        - '${PROXY}/${TESTCASE}'
      timeout: 600
device_type: ${DEVICE_TYPE}
```

Converted from YAML to JSON when submitting to LAVA

VARIABLE SUBSTITUTION

```
actions:
  - command: deploy_linaro_kernel
    parameters:
      dtb: 'http://192.168.2.10/am335x-boneblack.dtb'
      kernel: 'http://192.168.2.10/zImage'
      nfsrootfs: 'file:/home/voipio/debian-minimal.tgz'
      target_type: ubuntu
  - command: boot_linaro_image
  - command: lava_test_shell
    parameters:
      testdef_urls:
        - 'http://192.168.2.10/test_definition.yaml'
      timeout: 600
device_type: beaglebone-black
```

test-rtc script was automatically embedded in test_definition.yaml which is a lava_test_shell definition

BISECT CAVEATS

- Git tree needs to work in general for every commit
- -> Consider using lava-boot with `git-test-sequence` to verify all commits
- Complex merges and commits that touch unrelated files make bisecting hard
- -> Do self-contained commits and clean short-lived topic branches
- Bisecting randomly reproducible bugs gives wrong results!
