

How I Learned to Stop Worrying and Love Tumbleweed

Everyone should be running a rolling release

Richard Brown
openSUSE Chairman
rbrown@opensuse.org

“Rolling Releases are the future of Linux
Distributions”

The background features abstract geometric shapes in two shades of green. A large teal shape occupies the left and top portions, while a bright green shape is on the right. They are separated by a white diagonal line.

In the Beginning

Regular Releases aka “Traditional Distributions”

- Most Linux Distributions follow a “Regular Release” model
- Release every X months/years
- Freeze/Reluctantly upgrade package versions between Releases
- Backport patches/fixes for frozen package versions
- e.g. Debian, Fedora, openSUSE Leap, Ubuntu

Dev Branches

- Most Linux Distributions rely on a Dev Branch to seed their Regular Releases
- Always Released
- Nothing Frozen/Backported
- Normally Broken
- e.g. Debian sid, Fedora Rawhide, openSUSE Factory, Ubuntu Daily

The Problems for Developers

- Developers need their system to be as close as possible to their relevant upstream/distribution projects
- Dev Branches accomplish this, but at the cost of stability
- If it's not stable, Developers will not use it, they have work to do

The Problems for Distributions

- Fewer Users/Contributors of the Dev Branch is a serious, but common problem
- Fewer bugs found before each Regular Release
- Less innovation/new features in your codebase
- Increasing Technical Debt, making each Release more 'expensive' to clear that debt
- Stagnation/Decline, often with very public development probs

The Problems for Upstream Developers

- Upstream Developers want to put their software in the hands of users as fast as possible
- Dev Branches do not accomplish this, neither do Regular Releases
- Containerised Apps promise to solve this, but it's not that easy

Come see my other talk “Resurrecting Dinosaurs”

Janson 13:00 TODAY

The Problems for Users

- Many Linux Users are enthusiasts with a keen interest in the upstream projects of their choice
- These users don't want to wait, but when they use it they want it to work
- Consistency, 'well put together', 'feels right', UX, are key requirements
- These enthusiasts are the prime candidates to become contributors of tomorrow

Rolling Releases to the Rescue

Rolling Releases to the Rescue

- No Release Schedule
- Frequent Updates to all Packages
- Updates delivered “when they're ready”
- e.g. Arch, Gentoo, openSUSE Tumbleweed

Rolling Releases – Common Problems

- Unstable
- Unreliable
- Hard to Live With

Unstable

- “Always Changing”
- A fast moving codebase is going to include changes, that’s the point
- Changes must be built, tested, and integrated consistently
- Users must be shielded from behavioural changes so they can just focus on getting their work done, then change when they’re ready

Unreliable

- “Always Breaking”
- Thousands of moving parts from thousands of upstream projects are a challenge to get working together
- Changes must be built, tested, and integrated consistently
- Test-at-the-submission & Test-as-a-whole; Distributions are not a collection of packages, but a cohesive product
- Users must not be shipped something that doesn't work

Passive Testing is not good enough!

- Many distributions, incl. rolling releases, rely on “Passive Testing”
- Put new packages in a “Testing Branch”, wait X days then assume “it’s good enough” and ship!
- Works better or worse depending on size of developer & testing communities
- Still basically Russian Roulette

Active Testing is required

Rolling Releases SHOULD actively confirm:

- “does the new package break something in isolation?”
 - “does the new package break something when installed in a broader context?”
 - “does the new package change behaviour users expect?”
-
- Answers to the above questions needed ideally BEFORE an Upstream Release or ASAP after

Hard to Live With

- The Arch Way - “Do it yourself, it’s a learning exercise”
- The Gentoo Way - “Do it yourself, and you can read the Arch wiki while everything is compiling”
- Something went wrong or changed in a way you don’t like? Too bad, good luck undoing it, you can always start again

“Who said Rolling Releases needed to be difficult?”

The background features abstract geometric shapes in two shades of green. On the left, a large teal shape with a hexagonal-like form contains the text. To its right, a darker green shape also has a hexagonal-like form. These shapes are separated by white space, creating a modern, geometric aesthetic.

Enter Tumbleweed

A Brief History of Tumbleweed

- Originally created by Greg Kroah-Hartman
- Merged with the 'Factory' rolling release on November 4th 2014
- Provides the latest updates 'at the pace of contribution', without the risk of major system issues
- Tested by openQA continuously
- Developer, Contributor & Enthusiast focus

OG Tumbleweed (Pre Nov 2014)

- Tumbleweed was originally 'rolling updates' based on regular releases
- Required an additional repository to your 'traditional' openSUSE release
- Focus on Kernel, KDE, GNOME and some Apps
- Would overwrite packages from regular release
- “Reset-to-zero” every regular release

Original Tumbleweed, Original Troubles

- “Partially-Rolling” does not work
- Constant breakage over the growing chasm between the ‘stable base’ and ‘rolling top’
- Ad-hoc tinkering of the ‘stable base’ stops it being stable
- “Reset-to-zero” rebase to a new stable base every 8 months was brutally disruptive for many users

Richard's Rolling Release Rule

“In order to move ANYTHING quickly, you need to be able to move EVERYTHING quickly”

Building Linux Better

- Open Build Service started in February 2006
- Used to build the openSUSE® & SUSE® distributions
- Can also build packages for other distributions (Fedora/Red Hat, Ubuntu, Debian, Arch, etc)
- Also used by ownCloud, Linux Foundation, VideoLAN (VLC), Dell, Cray, Intel and more.

<http://openbuildservice.org>

Testing Linux Better

- openQA started in November 2009
- Able to fully test Linux distributions from install to user applications
- Integral part of the openSUSE® Tumbleweed & Leap process
- Used by SUSE® to test SUSE Linux Enterprise
- Recently adopted by Red Hat to test Fedora

“Fancy, but I don’t want to wait for all that
build & test nonsense”

Working with Upstream Projects

- GNOME 3.22 – Shipped <48 hours after Upstream Release
- KDE Plasma 4.9 – Shipped on Upstream Release Day
- “GNOME:Next” – Tumbleweed derivative testing GNOME git
 - LiveCD’s provided for Upstream Release Day
- openSUSE Krypton – Tumbleweed derivative testing KDE git

A “quiet” Tumbleweek

- 3 Snapshots
- 146 Package Updates
- 15 New Packages on the DVD
- 38 Packages Removed from the DVD
- 1 new Kernel

A “quiet” Tumbleweek

- 3 Snapshots
- 146 Package Updates
- 15 New Packages on the DVD
- 38 Packages Removed from the DVD
- 1 new Kernel

QUIET?!

Another Tumbleweek

- 5 Snapshots
- 298 Package Updates
- 47 New Packages on the DVD
- 42 Packages Removed from the DVD
- 2 new Kernels

btrfs & snapper – our secret sauce

- Tumbleweeds default install uses btrfs & snapper
- Automatically configured to snapshot root filesystem when packages are installed
- Unwanted changes can be safely rolled back, even from GRUB

“Transactional Updates with btrfs” - Thorsten Kukuk

“What about the openSUSE Regular Release?”

The New openSUSE Distributions

- openSUSE Tumbleweed
 - Rolling Release
 - Continuously Updated & Tested
 - Perfect for Developers & Power Users
- openSUSE Leap
 - Regular Release
 - Shared Core with SUSE Linux Enterprise
 - Perfect for SysAdmins, Enterprise Developers, and Users

In Review

Tumbleweed for Developers

- Keep close to your chosen upstream projects
- Get the latest and greatest versions of everything
- “It just works”, and if it doesn’t work the way you want any more, snapper rollbacks keep you working
- Something not quite perfect? Please contribute back, so we can help make Tumbleweed even better for you

Tumbleweed for Upstream Developers

- Roll with us and you get packaging experts to help, cross-distro packaging tools, and unparalleled automated functional testing
- Containerised Applications are cool for those ‘other’ distributions, but are more work for you

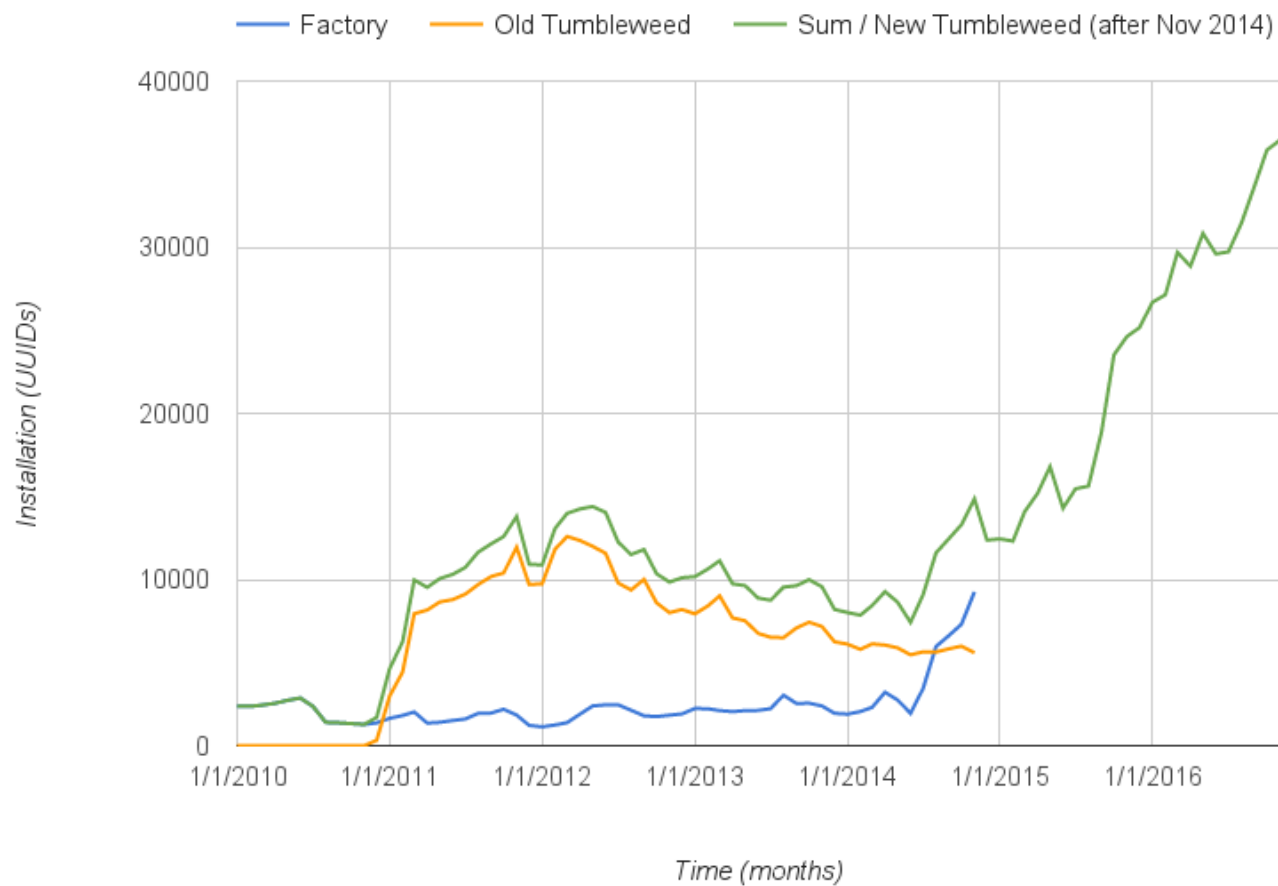

Tumbleweed for Users

- Get the latest and greatest versions of everything
- “It just works”, and if it doesn’t work the way you want any more, snapper rollbacks keep you working
- Having a lot of fun? Please contribute back, so we can help make Tumbleweed even better for you

Tumbleweed Growth
