

Developing applications using OpenStack Swift as Storage

All about the API features to power up your apps

Christian Schwede, Software Engineer, Red Hat

FOSDEM 2018, Brussels

What is OpenStack Swift?

- Object Storage
- Flat namespace
- Unstructured data
- Scalable, durable, reliable
- In production for ~8 years

SWIFT

an OpenStack Community Project

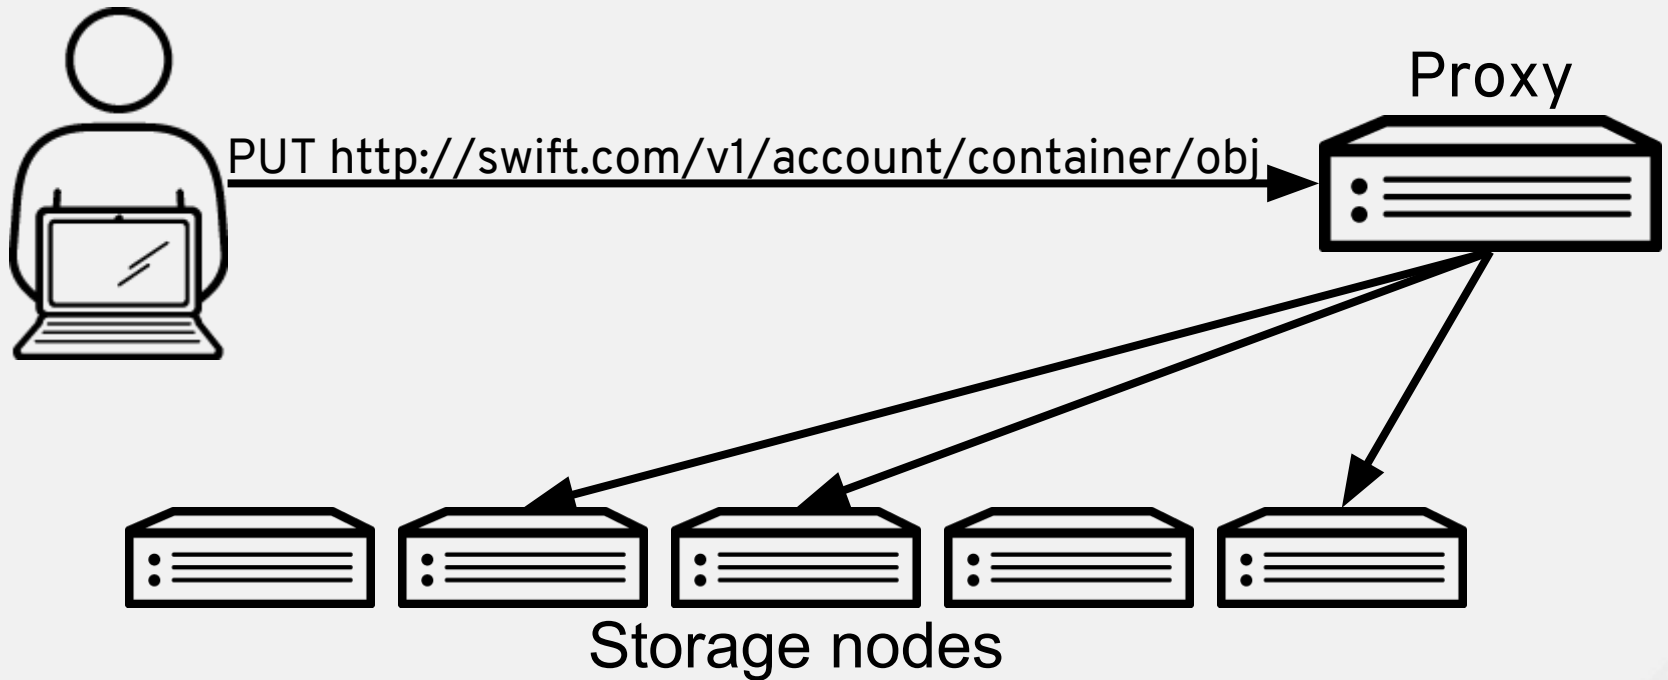

<https://video.fosdem.org/2018/>, Room H.2213

The big picture

REST API

Swift uses a simple REST API based on GET, PUT, HEAD, POST requests

REST API

Swift uses a simple REST API based on GET, PUT, HEAD, POST requests

```
# List objects in a (public readable) container
curl http://192.168.2.1:8080/v1/AUTH\_test/public

# Download a (public readable) object
curl http://192.168.2.1:8080/v1/AUTH\_test/public/obj

# Upload an object
curl http://192.168.2.1:8080/v1/AUTH\_test/cont/obj \
-X PUT -H "Content-Length: 36816" \
-H "X-Auth-Token: AUTH_tk5917..."
```

<https://developer.openstack.org/api-ref/object-store/index.html>

Headers, metadata & swift CLI

System metadata & custom metadata

```
# Generally: try "--debug" with the swift CLI
swift --debug list container
```

```
curl http://192.168.2.1:8080/v1/AUTH\_test/cont/obj \
-X POST
-H "X-Delete-After: 5" \
-H "X-Object-Meta-Some: value"
```

```
swift post -H "X-Delete-After: 5" -m "Some: value"
```

<https://developer.openstack.org/api-ref/object-store/index.html>

Authentication

tempauth

Built-in auth for development & testing. Don't use in production

```
curl -I \  
-H "X-Auth-User: test:tester" \  
-H "X-Auth-Key: testing" \  
http://192.168.2.1:8080/auth/v1.0
```

```
< X-Storage-Url: http://192.168.2.1:8080/v1/AUTH_test  
< X-Auth-Token: AUTH_tk5917...
```

```
curl -I -H "X-Auth-Token: AUTH_tk59..." \  
http://192.168.2.1:8080/v1/AUTH\_test
```

```
< X-Account-Object-Count: 9
```

Keystone

The default auth in OpenStack

```
curl -i -H "Content-Type: application/json" \  
  -d '{"auth": {  
    "identity": {  
      "methods": ["password"],  
      "password": {  
        "user": {  
          "name": "admin",  
          "domain": { "id": "default" },  
          "password": "adminpwd"  
        }  
      }  
    }  
  }'  
  "http://192.168.2.1:5000/v3/auth/tokens"
```

tempurl

Pre-computed URLs for one specific object action

```
swift post -m "temp-url-key: secret" containername
```

```
import hmac
from hashlib import sha1
from time import time
method = 'GET'
expires = int(time() + 60)
path = '/v1/AUTH_test/cont/obj'
key = 'secret'
```

```
hmac_body = '%s\n%s\n%s' % (method, expires, path)
sig = hmac.new(key, hmac_body, sha1).hexdigest()
```

http://swift.com/v1/AUTH_test/cont/obj?temp_url_sig=5d4aa...&temp_url_expires=1517568481

formpost

Similar to tempurl, but for HTML forms

```
# Like tempauth, plus:

redirect = 'https://srv.com/some-page'
max_file_size = 104857600
max_file_cnt = 10

hmac_body = '%s\n%s\n%s\n%s\n%s' % (
    path, redirect, max_file_size, max_file_cnt, expires)

signature = hmac.new(key, hmac_body, sha1).hexdigest()
```

<https://docs.openstack.org/swift/latest/middleware.html#formpost>

ACLs

```
# Make container listing and objects public readable
swift post -r ".r:*,.rlistings" public
```

```
# Allow "user2" to write to container
swift post -w "tenant:user2" public
```

```
swift stat container
> Read ACL: .r:*,.rlistings
> Write ACL: tenant:user
```

Authentication summary

	Account	Container	Object
anonymous	X	✓	✓
w/ Token	✓	✓	✓
tempurl	X	X	✓
formpost	X	X	✓

API Features

Container listings

Listings can be modified using querystring parameters

limit=2	Returns only 2 entries
marker=1000	Starts List with object names larger than marker
end_marker=2000	List ends with object names smaller than end_marker
prefix=sub/	Only returns objects whose name start with the prefix “sub/”
reverse=on	Reverse order listing
format=json	Returns list as JSON (can be XML as well)

http://192.168.2.1:8080/v1/AUTH_test/public?limit=2

Expiring objects

Blocks request after given time and deletes objects shortly after

```
curl http://192.168.2.1:8080/v1/AUTH_test/cont/obj \  
-X PUT -H "X-Auth-Token: AUTH_tk591..." \  
-H "X-Delete-After: 5"
```

```
curl http://192.168.2.1:8080/v1/AUTH_test/cont/obj \  
-X PUT -H "X-Auth-Token: AUTH_tk591..." \  
-H "X-Delete-At: 1517210485"
```

Static large objects

- Objects are limited to 5GB by default
- Split larger objects into chunks
- Upload them, and finally a manifest

```
[{"path": "/cont/chunk_00001",  
  "etag": "etagofoftheobjectsegment",  
  "size_bytes": 10485760,  
  "range": "1048576-2097151"},  
...]
```

```
$ curl -X PUT http://.../cont/obj?multipart-manifest=put
```

Range requests

Sounds simple, but especially wanted for video (seeking, preview)

```
# obj content: "Hello World from Fosdem!"
```

```
# Returns only "Hello"
```

```
curl http://192.168.2.1:8080/v1/AUTH_test/cont/obj \  
-X PUT -H "X-Auth-Token: AUTH_tk5917..." \  
-H "Range: bytes=0-5"
```

```
# Returns multipart/byteranges + "Hello Fosdem!"
```

```
curl http://192.168.2.1:8080/v1/AUTH_test/cont/obj \  
-X PUT -H "X-Auth-Token: AUTH_tk5917..." \  
-H "Range: bytes=0-5,16-"
```

Versioning

Keeps objects in given container when they are DELETED

```
curl -i http://192.168.2.1:8080/v1/AUTH_test/fosdem \  
-X PUT -H "X-Auth-Token: AUTH_tk187..." \  
-H "X-History-Location: archive"
```

```
# After object delete archive container looks like:  
006fosdem/1517212630.62613  
006fosdem/1517212640.36957
```

https://docs.openstack.org/swift/latest/overview_object_versioning.html

CORS

Cross-origin resource sharing

Enable CORS by setting header
X-Container-Meta-Access-Control-Allow-Origin on container to
<http://static.example.com>

<https://docs.openstack.org/swift/latest/cors.html>

Examples

AngularJS + public container

```
$http.get(base_url + "?prefix=img").then(
  function(response) {
    imgs = response.data;
    showImage(index);
  }
);

var showImage = function() {
  $scope.img = base_url + "/" + imgs[index].name;
  $http.head($scope.img).then(
    function(response) {
      $scope.headers = response.headers();
    }
  );
}
```

Creating tempurls in Lua

```
local function tempurl(url, key, method)
    local expires = tostring(os.time() + 900)
    local path = url:match(".*(v1/.*)$")

    local hmac_body = string.format(
        "%s\n%s\n%s", method, expires, path)

    local sig = LrDigest.HMAC.digest(
        hmac_body, 'SHA1', key)

    return string.format(
        "%s?temp_url_sig=%s&temp_url_expires=%s",
        url, signature, expires)
end
```

<https://github.com/cschwede/OpenStackSwift.Irplugin/>

Python

Simplest way: use python-swiftclient

```
from swiftclient import client
try:
    (storage_url, auth_token) = client.get_auth(
        auth_url, username, password, auth_version)
except client.ClientException:
    # log error here

client.get_account(storage_url, auth_token)

client.put_container(storage_url, auth_token,
                    container)
```

Creating secret for tempurl/formpost

```
account = client.get_account(
    storage_url, auth_token)
key = account[0].get('x-account-meta-temp-url-key')

if not key:
    chars = string.ascii_lowercase + string.digits
    key = ''.join(
        random.choice(chars) for x in range(32))

headers = {'x-account-meta-temp-url-key': key}

client.post_account(
    storage_url, auth_token, headers)
```

How do I get started?

```
git clone https://github.com/cschwede/dockerswift/
cd dockerswift
docker build -t swift .
docker run -p 8080:8080 -v node:/srv/node swift

virtualenv swift-venv
source swift-env/bin/activate
pip install python-swiftclient
export ST_USER=test:tester
export ST_KEY=testing
export ST_AUTH=http://192.168.2.101:8080/auth/v1.0

swift --debug [list|stat]
```

redhat.

THANK YOU!
