

# GStreamer & Rust

Fast, safe and productive multimedia software

FOSDEM 2018 – Rust devroom

4 February, Brussels

Sebastian Dröge < [sebastian@centricular.com](mailto:sebastian@centricular.com) >

# Introduction

**Who?**

**What?**

+

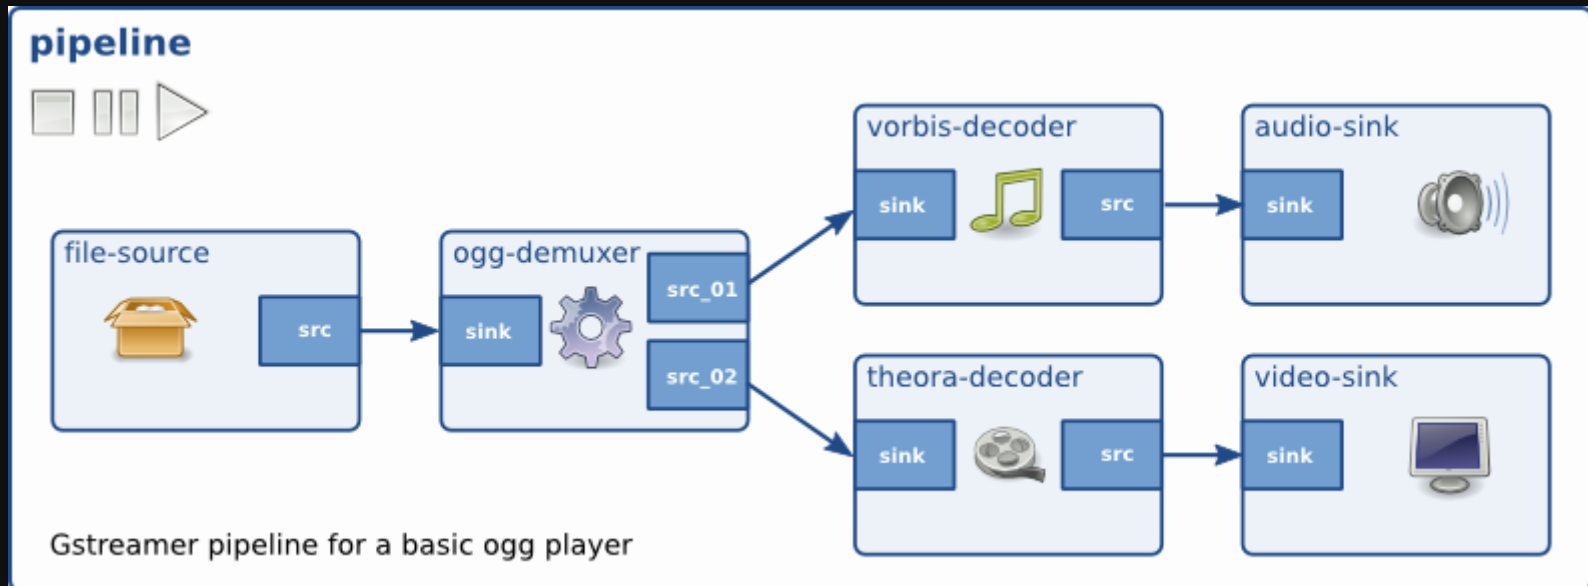

# What is GStreamer?

<https://gstreamer.freedesktop.org> for more details

# GStreamer

Pipeline-based, cross-platform  
multimedia framework

# Media Pipelines

# Philosophy

Toolbox for higher-level multimedia processing

Batteries included ...

... and usable from many languages

# But not ...

- Media player or playback library
- Codec and protocol library
- Transcoding tool
- Streaming server

... can be used to build all that!

**GStreamer ♥ Rust**

# Why Rust?

Memory-safety, fearless concurrency  
& modern language and tooling

# Why Rust?

No runtime, no GC & zero-cost abstractions

# Why Rust?

Ownership model maps perfectly to GStreamer's

# Using GStreamer from Rust

# Applications

Safe, idiomatic bindings to the GStreamer C API

- <https://github.com/sdroege/gstreamer-rs>
- Examples: [gstreamer-rs/examples](#)
- Tutorials: [gstreamer-rs/tutorials](#)

# Plugins

Safe, plain Rust infrastructure for writing plugins

- <https://github.com/sdroege/gst-plugin-rs>
- Contains various examples
- Tutorials being written right now

# The Future

Write more Rust & write less C

- more plugins (rust-av!),
- more useful applications

This is where **you** can get involved!

We're not going to rewrite GStreamer (yet)

It's the perfect time for writing your next  
GStreamer application or plugin in Rust

**Rust experience so far**

**Don't be afraid of unsafe code if needed ...**

... but wrap in safe abstractions

# **Don't be afraid of other people's code**

Adding dependencies is easy,  
and many things exist already

**Don't be afraid of *performance penalties*  
for using higher-level abstractions**

Write readable code and optimize later

**Not all is perfect yet  
... but the language is continuously improving**

# Wishlist

- Non-lexical lifetimes \*
- SIMD \*
- custom allocators \*
- const generics & const fns +
- better cargo integration into other build systems +
- stable/defined ABI for shared libraries

# Thanks

# ¿Questions?
