■ WLAN and ZigBee Transceiver

IEEE 802.11a/g/p – WiFi

WiFi networks, which are already ubiquitous today, will soon spread even further by providing the base for inter-vehicular communication systems. To study these networks, we provide a complete physical layer implementation, including a tool chain for simulation and experimentation.

[Learn more »](#)

IEEE 802.15.4 – ZigBee

Energy-efficient wireless networks have many important applications in health care, industrial automation, and form the base for an Internet of Things. We provide a complete IEEE 802.15.4 stack that is interoperable with the ContikiOS up to

WirelessHART

GNU Radio meets Scapy // Bastian Bloessl

Instant GNU Radio

Instant GNU Radio

- Built with Packer
- VM Image
- Many applications pre-installed
- Easy to extend and customize

Learn SDR

www.learn-sdr.org

The screenshot shows a web browser window with the URL <https://www.learn-sdr.org/>. The page title is "VM Setup :: Learn SDR". The browser's address bar shows the URL. The page content includes a navigation menu on the left with the following items: "1. Intro", "2. Setup", "VM Setup" (highlighted), "Customize VM", "3. Fospor", "4. GNU Radio", "5. DFS", "News", and "LINKS". The main content area has a breadcrumb trail "Home > Setup > VM Setup" and a link "Edit this page". The main heading is "VM SETUP" followed by "Import the VM". The text below states: "The VM comes as an **OVA** file, i.e., in Open Virtualization Format. That means it is a whole appliance, comprising VM setup and the disk image." There are blue navigation arrows at the bottom of the page.

VM SETUP

Import the VM

The VM comes as an **OVA** file, i.e., in Open Virtualization Format. That means it is a whole appliance, comprising VM setup and the disk image.

GNU Radio WLAN/ZigBee

- PHY only (MAC adds only static wrapper)
- No CSMA, no ACKs, no network stack
- **How can I send data?**
- **How can I interact with devices?**

A GNU Radio Radio Transceiver

"hello world!"

MAC

PHY

A Simple WLAN Frame

“hello world!”

MAC

PHY

A Simple WLAN Frame

Connecting to UDP Socket

- Netcat

```
31  
32 nc -u 127.0.0.1 52001  
33
```

- Python

```
vim udp.py  
1 #!/usr/bin/env python  
2  
3 import socket  
4  
5 MESSAGE = "Hello, from python!\n"  
6  
7 sock = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)  
8 sock.sendto(MESSAGE, ("127.0.0.1", 52001))
```

A Simple WLAN Frame

<data from UDP>

Virtual WLAN Device

Packet Crafting

- Ethernet frame (the hard way)

```
1 frame = struct.pack(\n
2     "!6s6sH", \n
3     binascii.unhexlify(dst.replace(":", "")), \n
4     binascii.unhexlify(src.replace(":", "")), \n
5     protocol)\n
6
```

Scapy

- Python turned into a domain-specific language
- Open Source
- <https://scapy.net/>

```
1 frames = Ether(dst="ff:ff:ff:ff:ff:ff")\
2           /IP(dst=["gnuradio.org", "libvolk.org"], ttl=(1, 9))\
3           /UDP(sport=12345, dport=52001)/"Hello World!"
4
5 list(frames)[0].show()
```

Packet Crafting

```
1 frames = Ether(dst="ff:ff:ff:ff:ff:ff")\
2         /IP(dst=["gnuradio.org", "libvolk.org"], ttl=(1,9))\
3         /UDP(sport=12345, dport=52001)/"Hello World!"
4
5 list(frames)[0].show()
```

```
###[ Ethernet ]###
dst      = ff:ff:ff:ff:ff:ff
src      = 08:00:27:d0:52:2e
type     = 0x800
```

```
###[ IP ]###
version  = 4
ihl      = None
```

```
###[ UDP ]###
sport    = 12345
dport    = 52001
len      = None
chksum   = None
```

```
###[ Raw ]###
load     = 'Hello World!'
```

Advantages

- More flexibility
 - Drivers
 - No device configuration
- No Prototypes (802.11p)
- More accessible (ZigBee)

Flow Graph with Scapy

WLAN Frames

- Beacon frame

```
1 frame = Dot11FCS(addr1='ff:..', addr2='23:..', addr3='23:..')\n2     /Dot11Beacon()/Dot11Elt(ID='SSID', info='GR WLAN')\n3 \n4 sock = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)\n5 sock.sendto(bytes(frame), ("127.0.0.1", 52001))\n6
```

- Fuzzing

```
1 frame = Dot11FCS(addr1='ff:..', addr2='23:..', addr3='23:..')\n2     /fuzz(Dot11Beacon()/Dot11Elt(ID='SSID', info='GR WLAN'))\n3 \n
```

- Deauth

```
1 frame = Dot11FCS(addr1=client, addr2=bssid, addr3=bssid)\n2     /Dot11Deauth()\n3 \n
```
