

Fixing healthcare data exchange with decentralized FOSS

Protect your API's with a decentralized trust layer

Steven van der Vegt

Open standard to enable safe and correct exchange of healthcare data.

Goal

Create a (inter)national network of connected nodes, to enable frictionless healthcare data exchange with the patient in control.

Breaking down the silos, enabling innovation, empowering care professions and patients.

Fixing healthcare data exchange with decentralized FOSS

- What is healthcare data exchange?
- Why is it broken?
- Why fix it with decentralized FOSS?

Medical data

- Medical files
- Lab results
- Electronic health records
- Images

Exchange

- Hospitals
- Mental healthcare institutions
- General practitioner
- Home care nurse
- Patient

NUTS

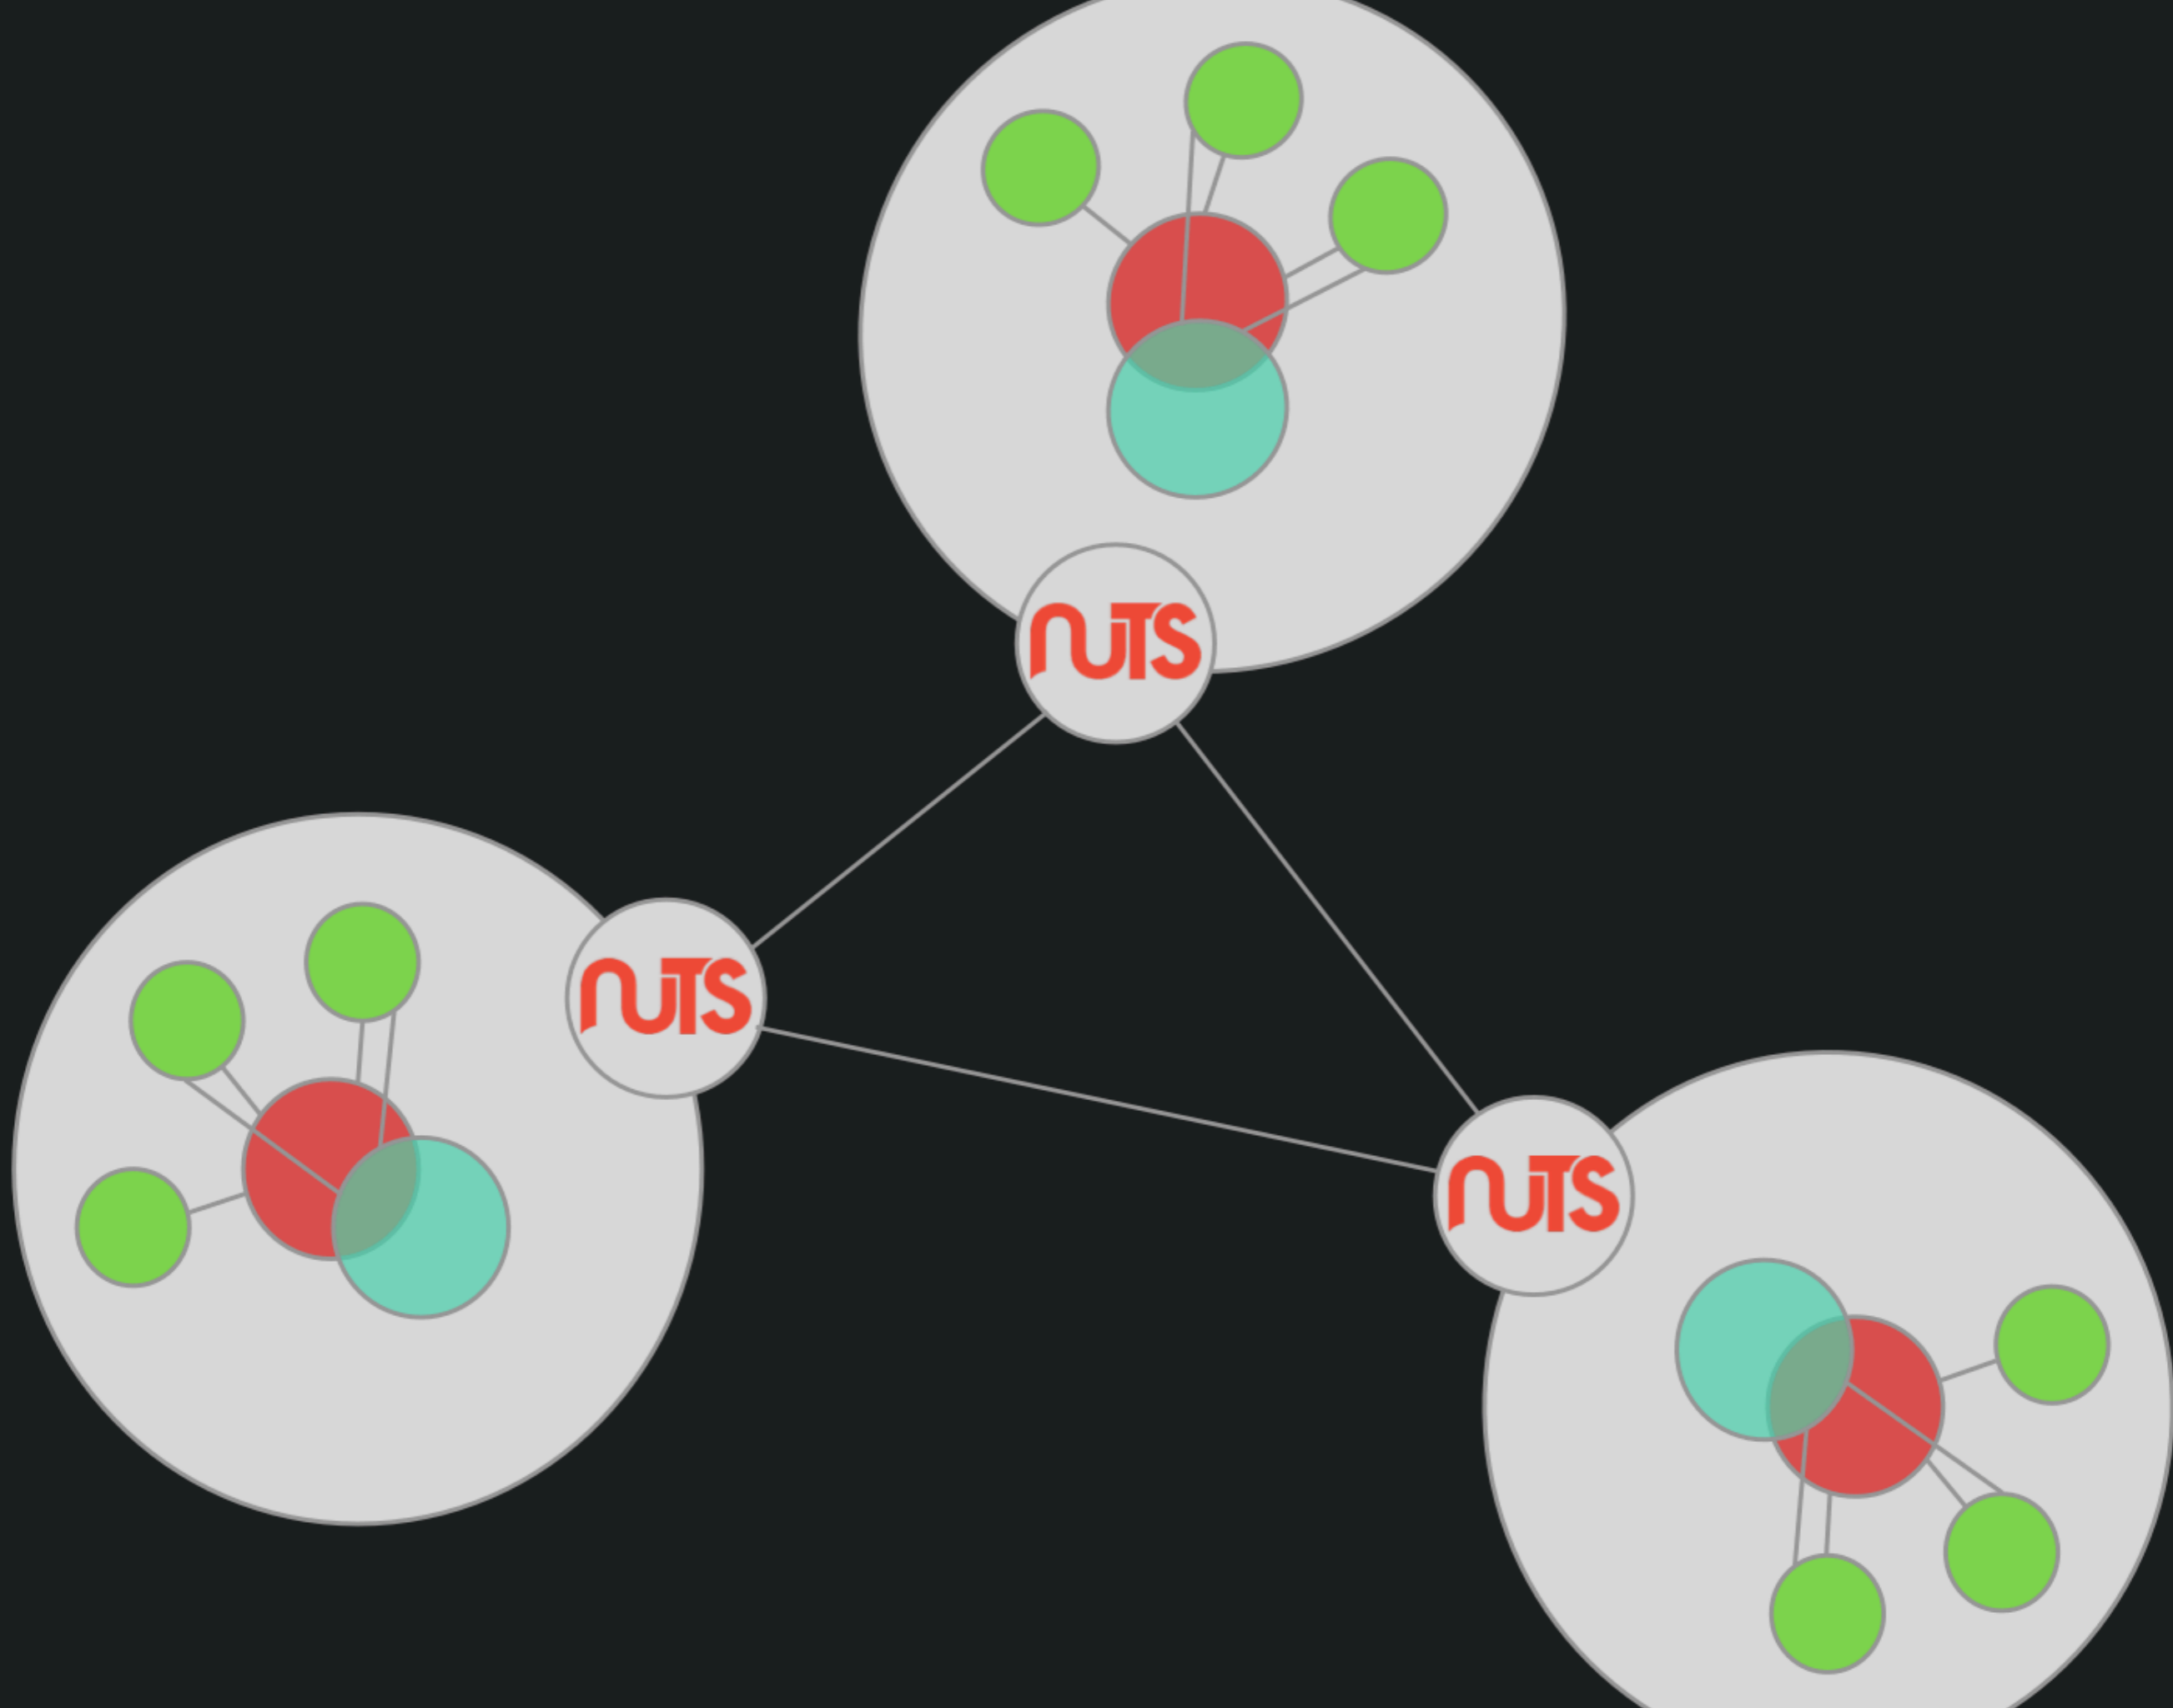

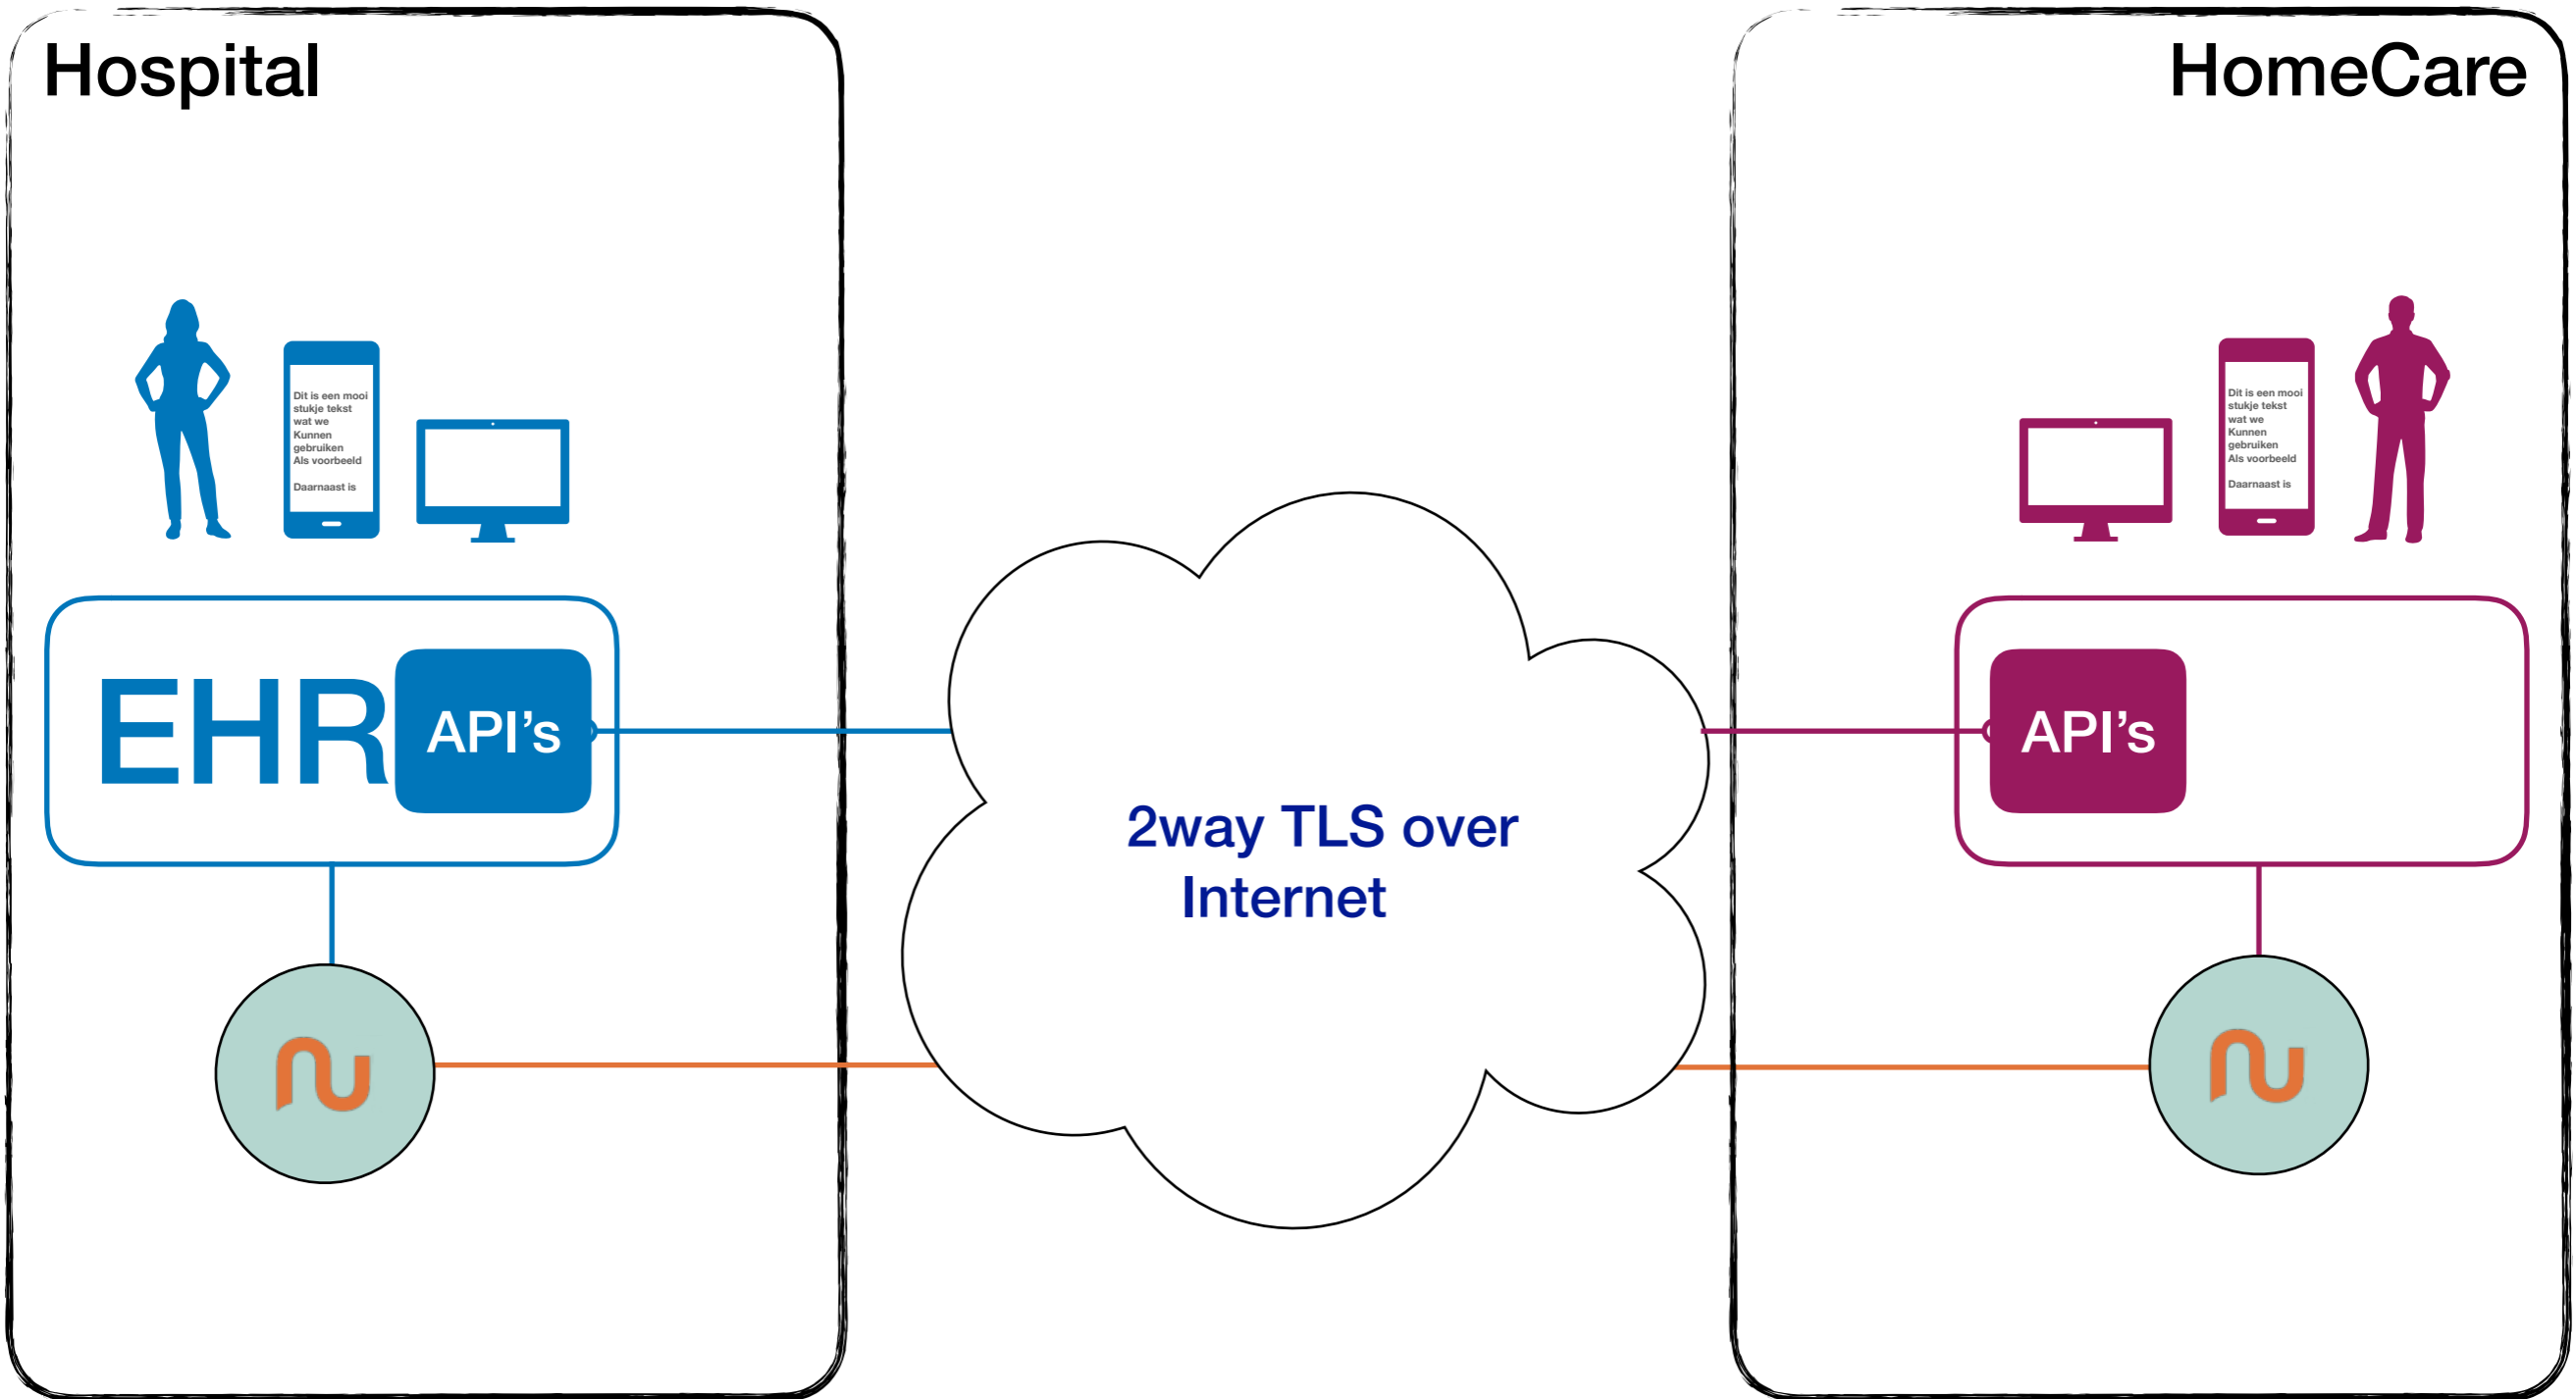

nuts

- Lots of small networks around a disease, financial flow, between vendors, regions etc.
- It is difficult to do it correct
- Standards are very broad but also incomplete

Logging

Internet

**No medical data over the
Nuts network, all p2p**

Everything is encrypted

**Data only exchanged
with relevant parties**

What is Nuts?

Nuts is a toolbox to secure all conditions needed for safe (medical) data exchange

1. Who is knocking (**identity**)
2. Where to knock (**discovery / registry**)
3. Is patient OK? (**consent, legal basis**)
4. What happened? (**Logging / audits**)

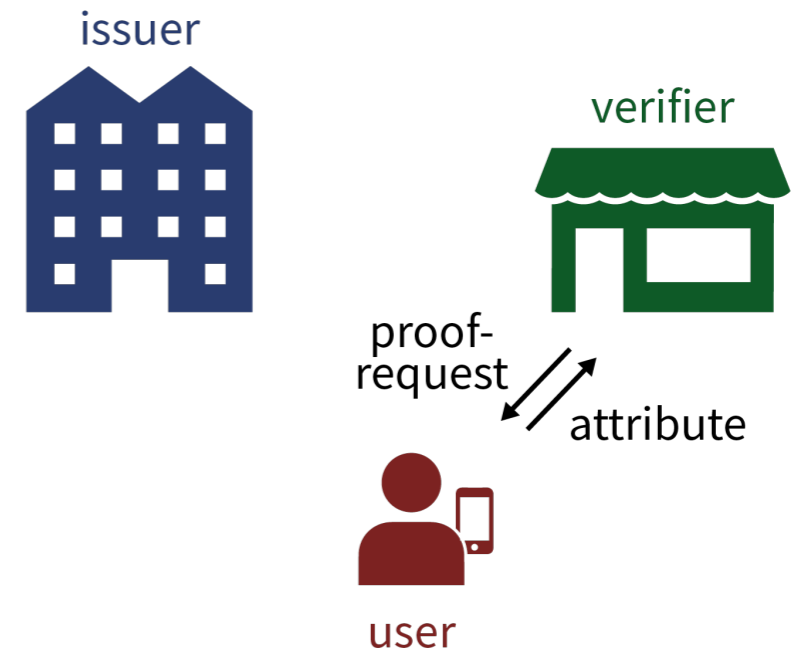

Decentralized Identity

- I Reveal My Attributes
- Secure offline channel from trusted issuer to verifier
- Able to sign contracts

IRMA

```
$ curl -X POST \  
http://localhost:11323/api/consent \  
-H 'Content-Type: application/json' \  
-d '{  
  {  
    "type" "PractitionerLogin"  
    "language" "EN"  
    "version" "v1"  
    "legalEntity" "Hospital East"  
    "valid_from"  
"2020-02-02T14:32:00+02:00"  
    "valid_to" "2020-12-24T14:32:00+02:00"  
  }  
}]'  
'
```

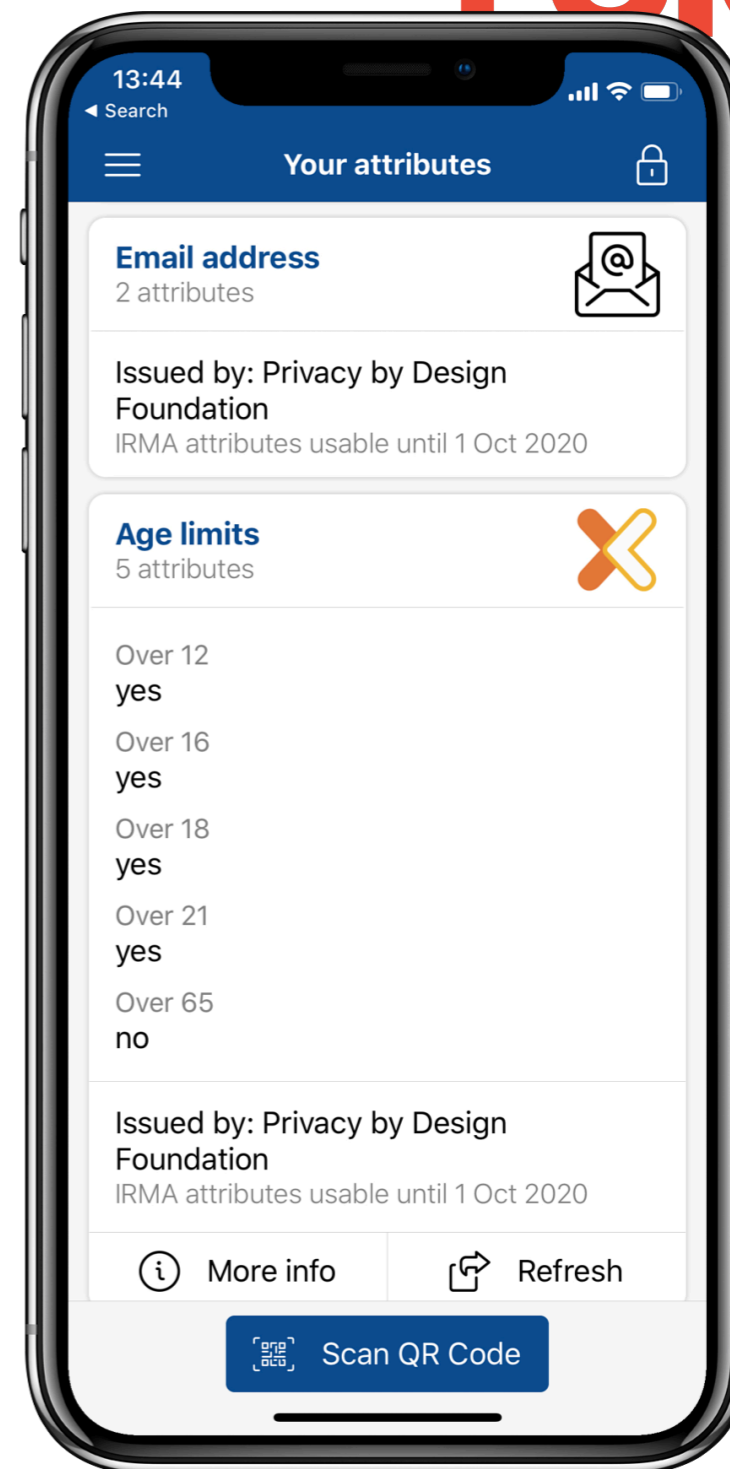

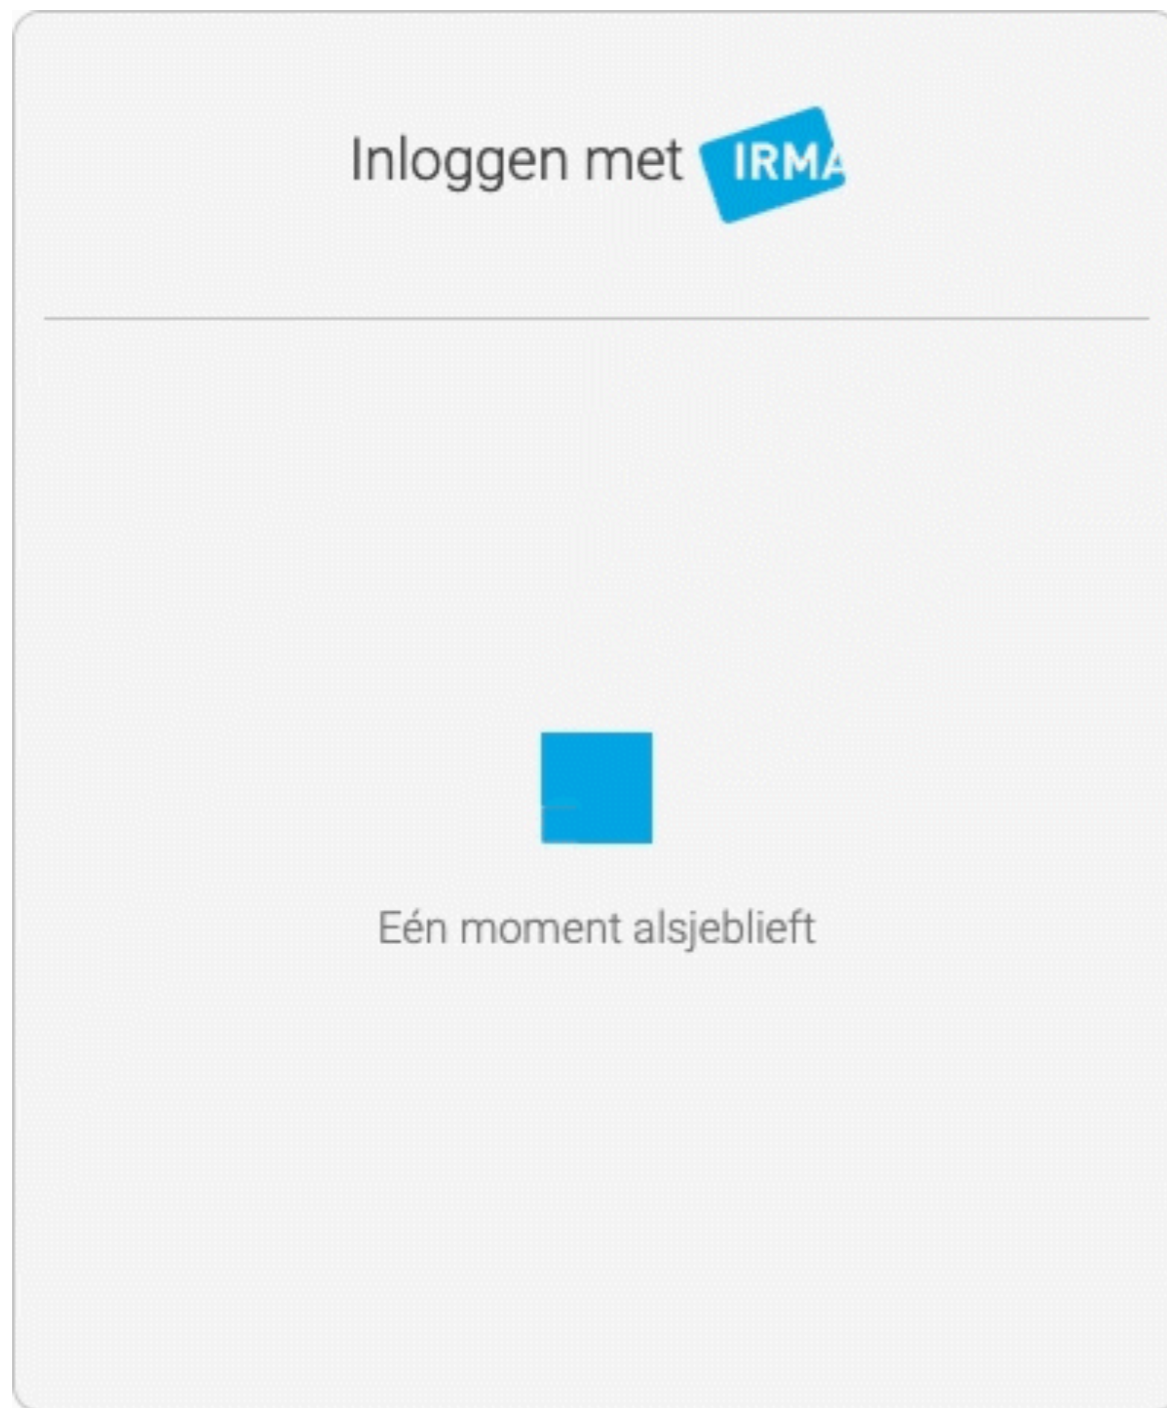

Attributes

Sign a contract

```
EN:PractitionerLogin:v1 I hereby give
permission to {{acting_party}} to make
request to the Nuts network on behalf of
{{legal_entity}}. This permission is valid
from {{valid_from}} until {{valid_to}}.
```

With the attributes: name, date of birth, medical number.

Patient consent

- Make sure there is a legal basis for the data exchange
 - Explicit consent
 - Implicit following a treatment
- Consent consists of a triple:
 - Custodian of the data
 - Actor (entity who gets the permission)
 - Patient
- Limited to medical scope, period, etc.

```
$ curl -X POST \  
http://localhost:11323/api/consent \  
-H 'Content-Type: application/json' \  
-d '{  
  "subject": "urn:oid:2.16.840.1.113883.2.4.6.3:999999990",  
  "custodian": "urn:oid:2.16.840.1.113883.2.4.6.1:000000000",  
  "actor": "urn:oid:2.16.840.1.113883.2.4.6.1:000000001",  
  "performer": "urn:oid:2.16.840.1.113883.2.4.6.1:000000007",  
  "records": [{  
    "consentProof": {  
      "ID": "11112222-2222-3333-4444-555566667777",  
      "title": "Toestemming inzage huisarts.pdf",  
      "URL": "https://some.url/path/to/reference.pdf",  
      "contentType": "application/pdf",  
      "hash": "string"  
    },  
    "period": {  
      "start": "2019-05-20T17:02:33+10:00",  
      "end": "2019-11-20T17:02:33+10:00"  
    },  
    "dataClass": [  
      "urn:oid:1.3.6.1.4.1.54851.1:MEDICAL"  
    ]  
  }]  
}'
```

Distributed by Corda

- Open source distributed trust framework
- p2p ledgers
- Uses notaries for consent
- A bit enterprising, but it does the job

Registry

- Where to find endpoints of type "Medication" for org "Hospital"?
- What's the current public key of an org "Hospital"
- Decentralized, managed by a chain of trust

Foundation

Software vendor

Care provider

Doctor

Verifies

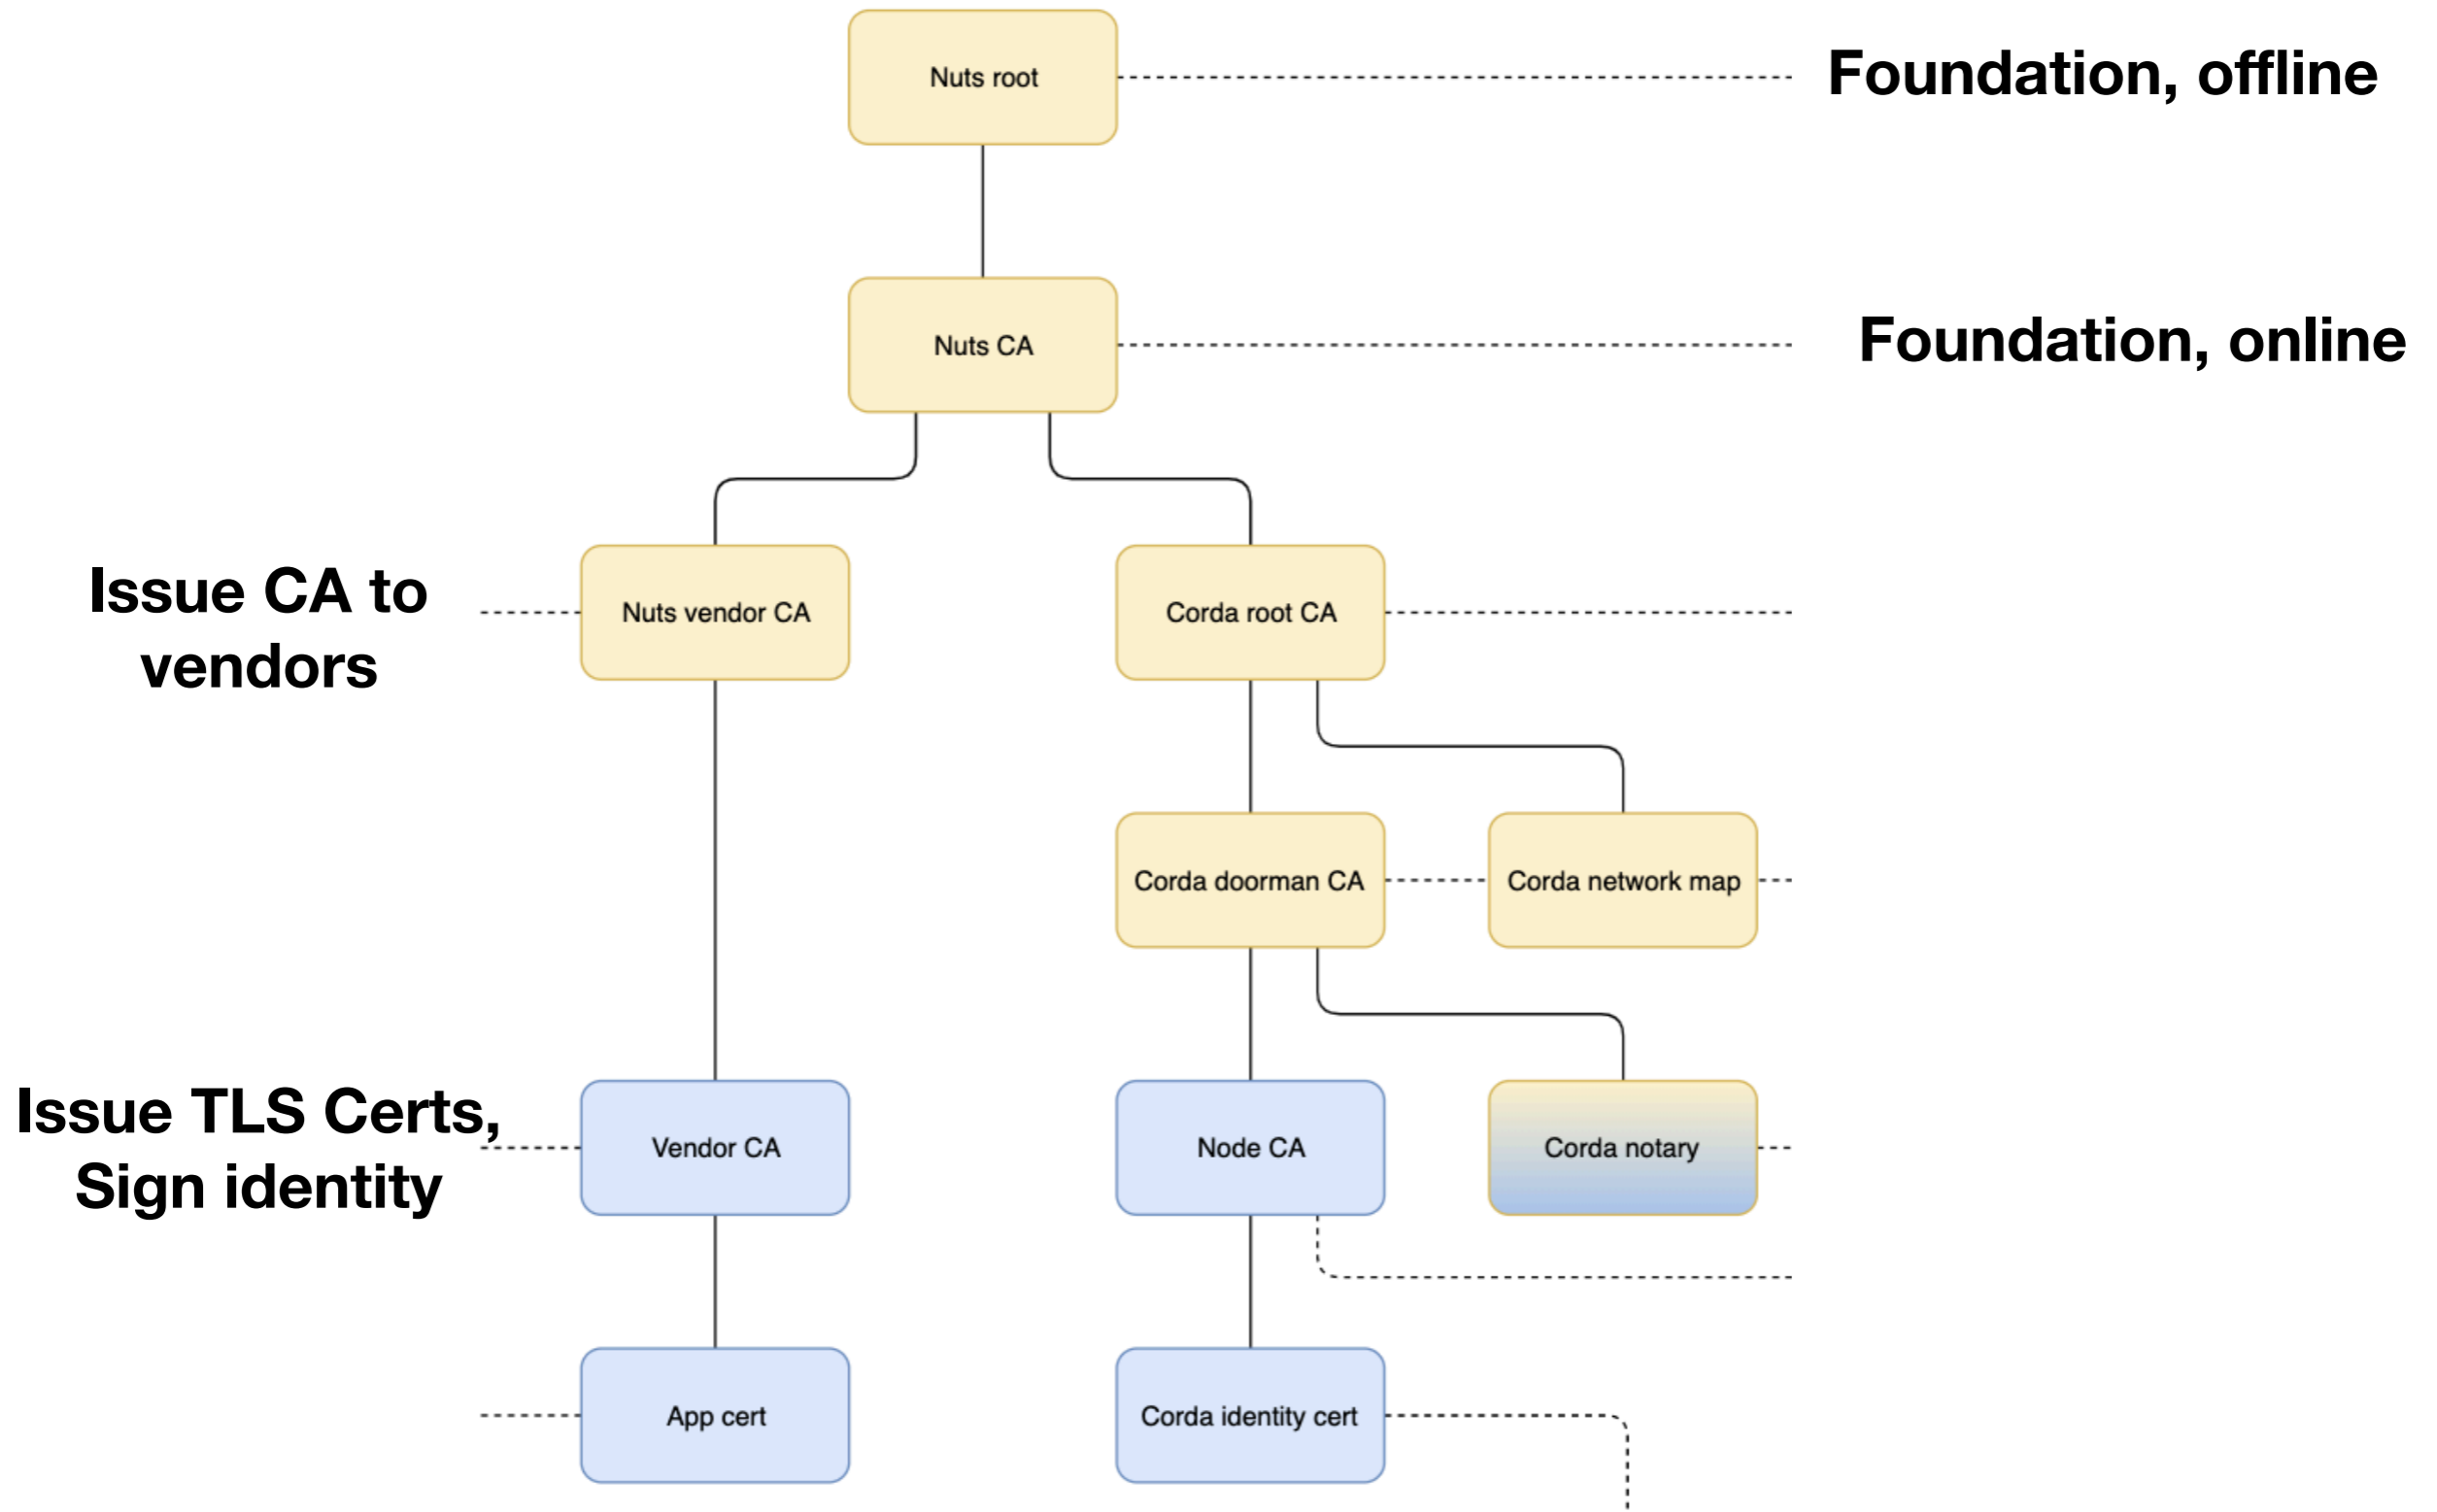

Recognize

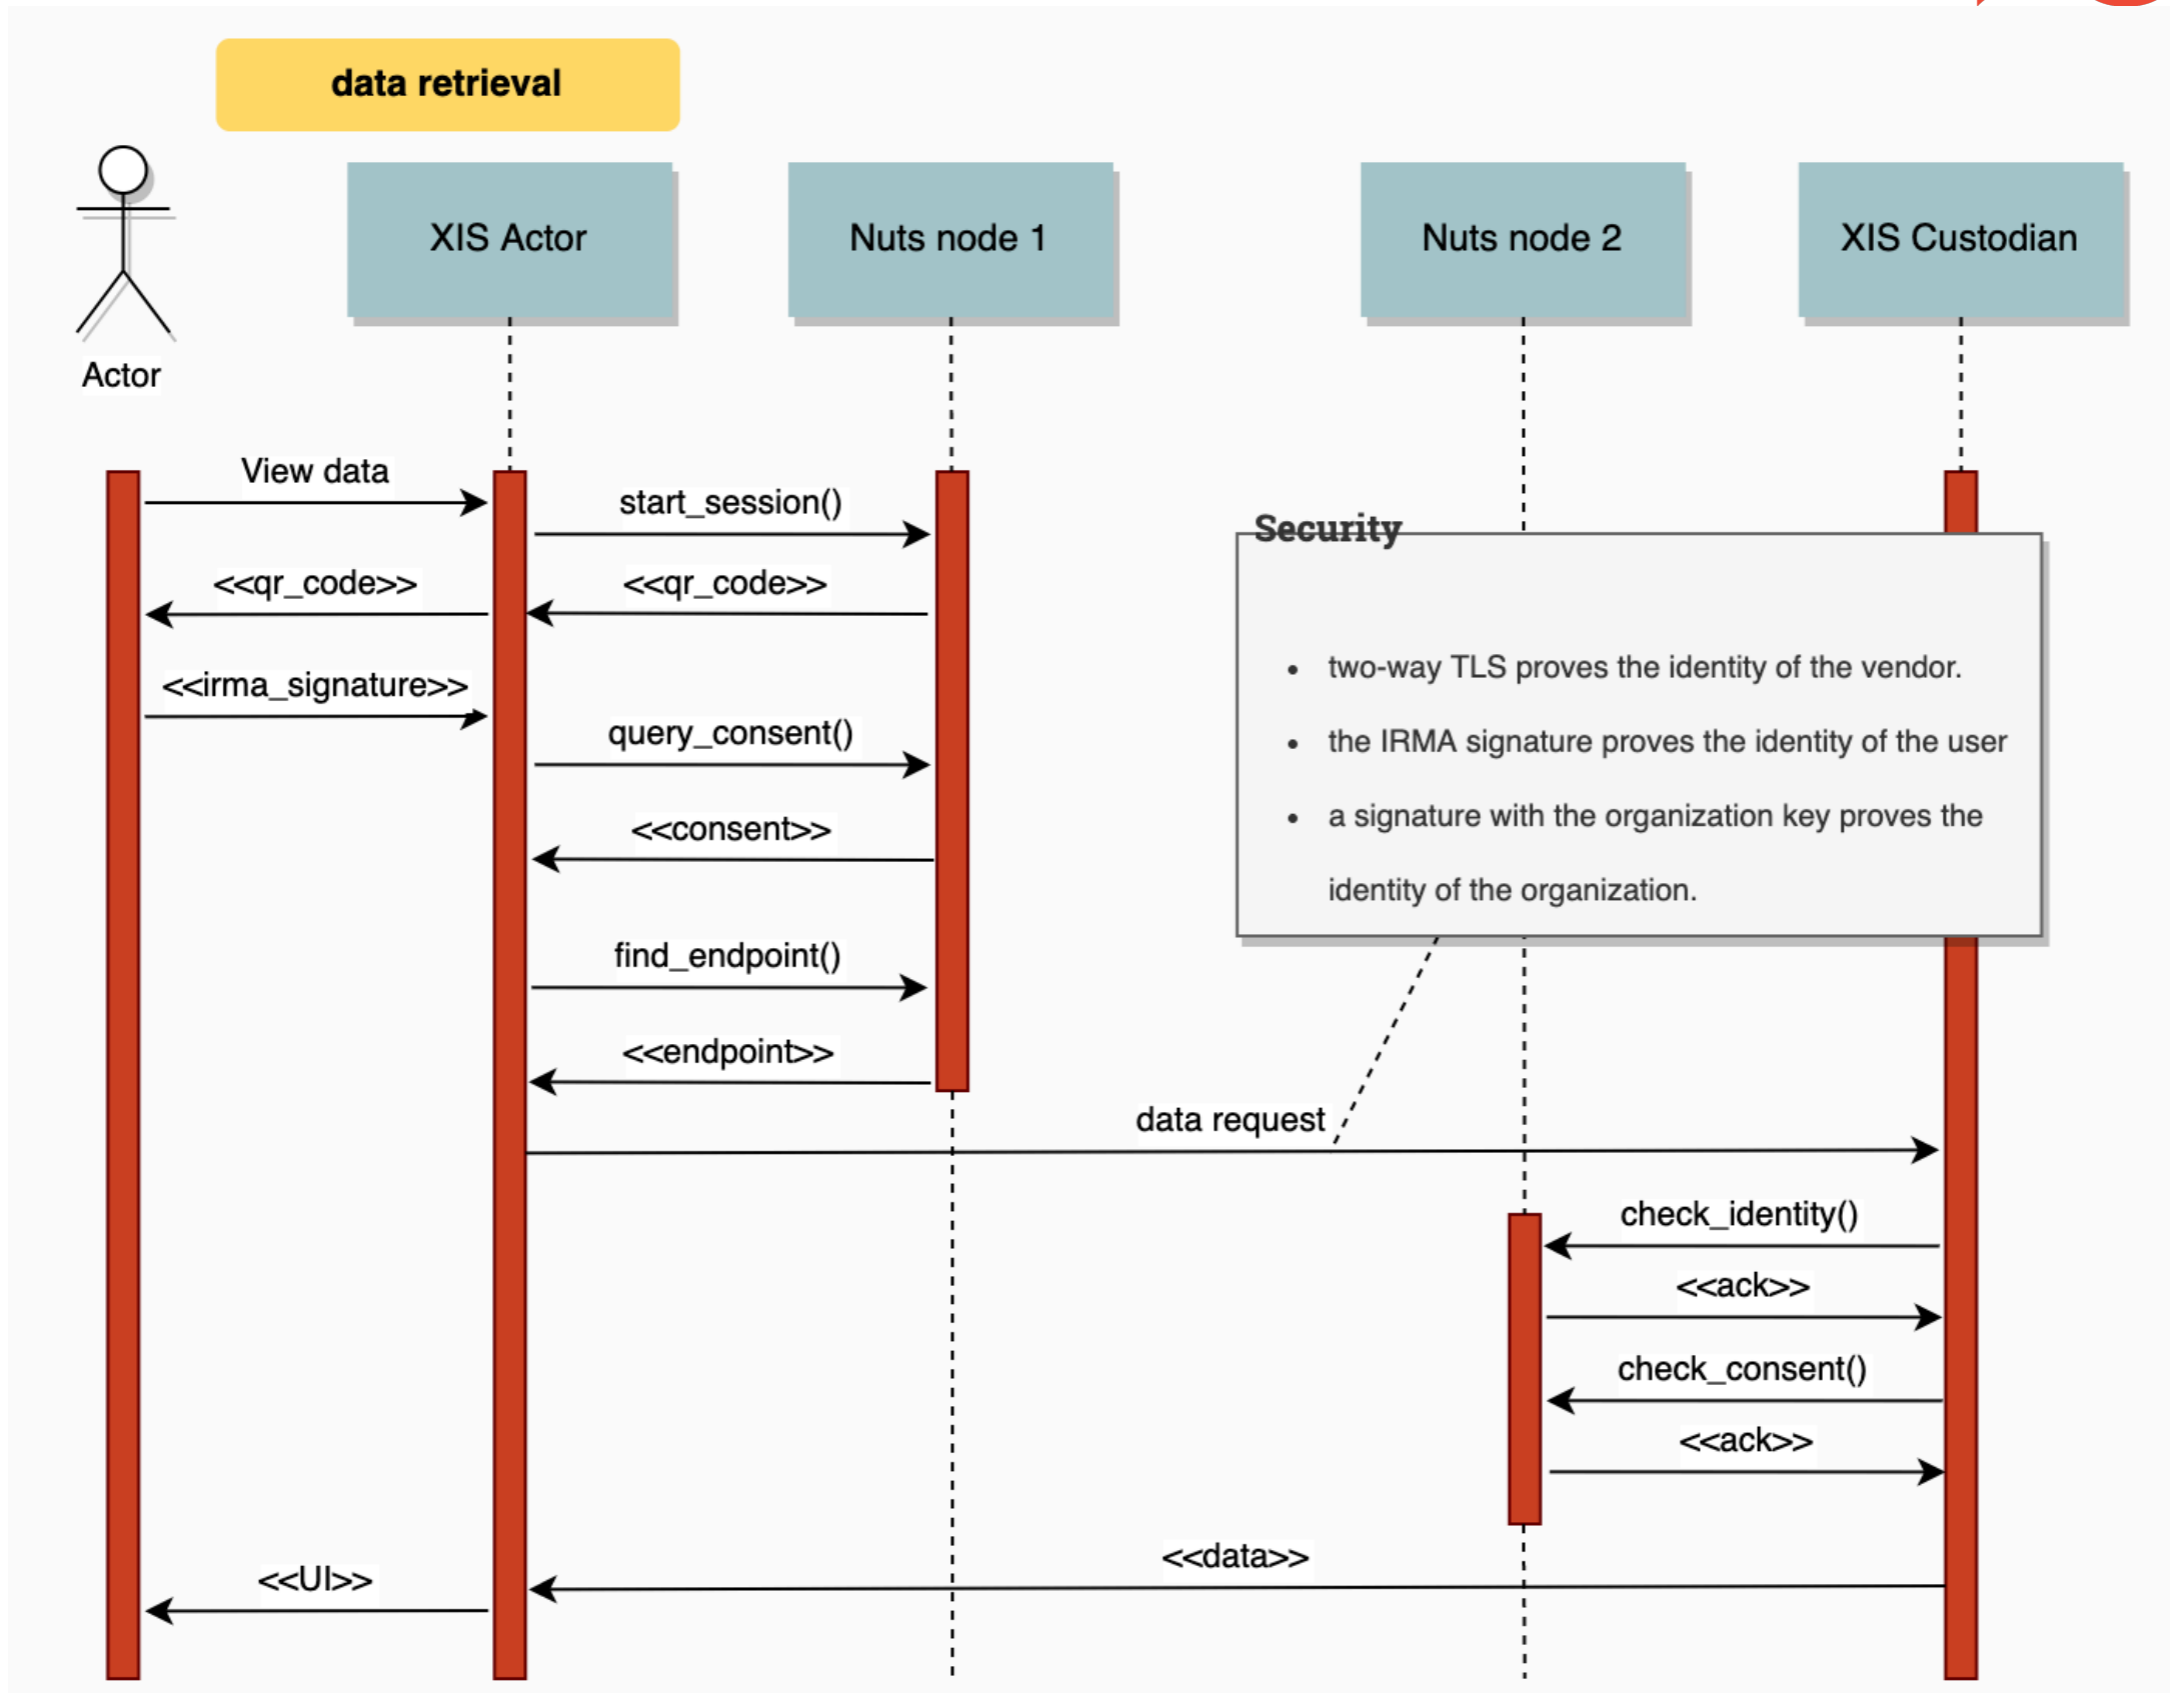

Is employee

Certificate tree

Data retrieval

What's in the box?

- Decentralized Identity
- Registry with chain of trust
- Local development network
- Demo UI
- Consent distribution
- Event system using nats.io

Developer Happyness

- Easy JSON Rest api
- All APIs in OpenAPI spec
- Simple documentation (in English)
- Getting started guides
- Example code
- Everything is containerized using Docker

Demo time!

- Oh boy....

Status

- We pissed some people of
- Part of an advisory board for the Ministry of Public Health
- 4 Pre-production nodes
- Won a privacy award (yeah!)
