# VVenC & VVdeC

## OPEN SOURCE VIDEO ENCODING AND PLAYBACK FOR VVC

---

H.264/AVC – x264

H.265/HEVC – x265

H.266/VVC – VVenC?

History, current state, and ecosystem  
around open source VVC implementations.

---

---

## About VVC...

# 50% more video compression, same quality

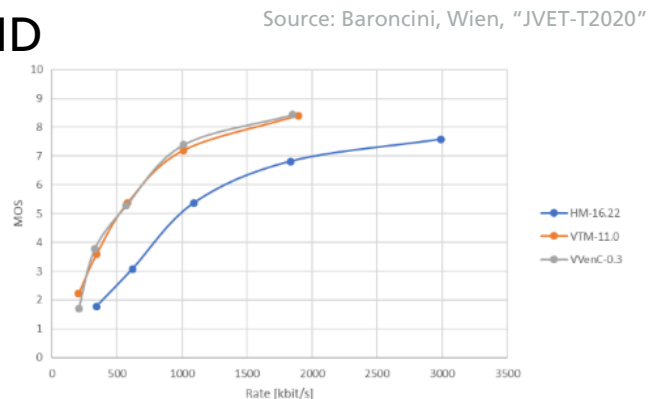

## H.266/VVC (Versatile Video Coding)

- Developed by JVET (Joint Video Experts Group)
- Finalized in July 2020
  - VVC Test Model (VTM) version  $\geq 10.0$
- Large bit-rate savings
  - ~50% vs HEVC
- Applicable in Versatile scenarios
  - Screen content
  - HDR, Immersive, 8K...
  - Open GOP adaptive streaming

### UHD

### HD

# History of VVdeC and VVenC

# The team behind VVenC and VVdeC

## Video Coding Systems Group at Fraunhofer HHI

- Fraunhofer HHI
  - German non-profit
  - Part of biggest European Research Organization
- Video Coding System Group
  - Main developers
- Your presenter... (me)
  - **Adam Wieckowski**
  - HHI since 2016
  - Project Lead since 2019
  - Group Co-Head since 2022

# New SW required for compression beyond HEVC

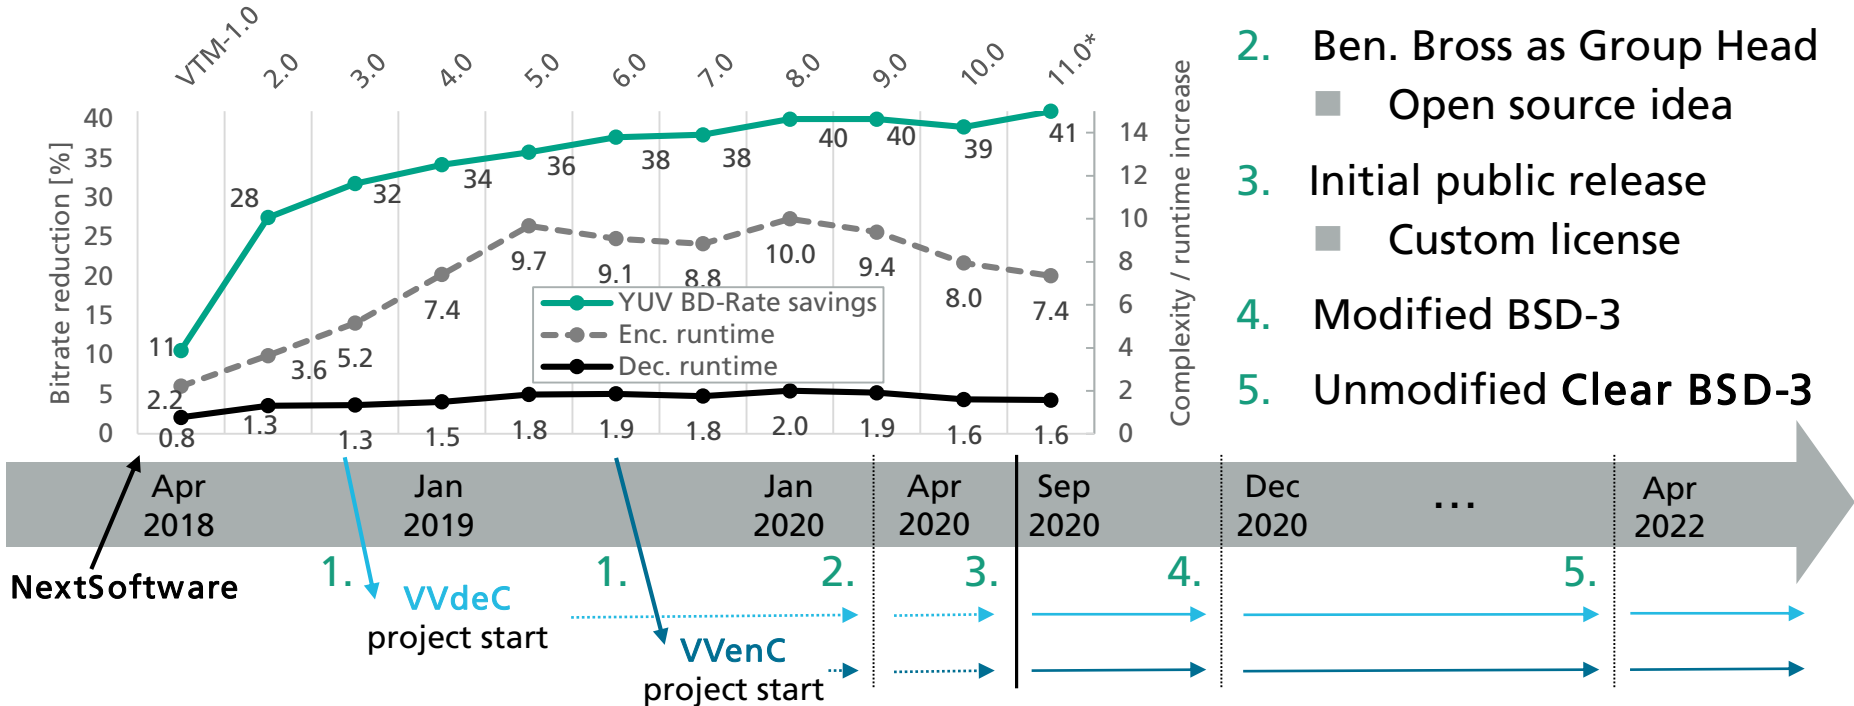

From HM, through NextSoftware, to VTM...

- All modern video codecs work block based
- HEVC used Quadtree -> only square partitions
  - HM uses **z-index** for block indexing
  - Amazing idea... for square blocks
- VVC -> rectangular partitions
  - JEM, based on HM, using **z-index**
  - Lots of code for working around **z-index**
- At HHI, we started work on a **new partitioner** (it didn't make it)
  - **z-index** utterly unbereable
  - Our own new SW, based on HM: **NextSoftware** (later VTM-1.0)
  - Blocks described by objects, with a global map (position -> CodingUnit)

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P	Q

# VVdeC and VVenC early in VVC development

## Major project milestones

---

# VVenC and VVdeC as OSS

# Hard facts about VVdeC and VVenC

- Based on VTM
- Fully in C++, with a pure-C interface
- Object based, made simple
- No assembler
  - Vectorization using intrinsics (impl. for C, SSE42/SIMDe, and AVX2)
  - ARM support for free
- Usage as simple as possible
  - Only use-case relevant options
  - Coding options optimal as-is

The screenshot shows two GitHub repository cards. The top card is for 'vrenc' (Fraunhofer Versatile Video Encoder (VVenC)), which is public, has 108 forks, 593 stars, and 6 issues. The bottom card is for 'vvdec' (Fraunhofer Versatile Video Decoder (VVdeC)), which is public, has 63 forks, 281 stars, and 4 issues. Both repositories are licensed under BSD-3-Clause-Clear and were updated recently.

- Available on **GitHub!**
- **BSD-3-Clause-Clear** license

# Development of VVdeC and VVenC

## A look behind the curtains

- Development internal, typical Git workflow
  - Internal, because... (see on the right)
- Periodical, squashed updates to GitHub
  - New versions
  - Bugs or issues
  - Early access to features
  - Rebase large contributions

# VVdeC

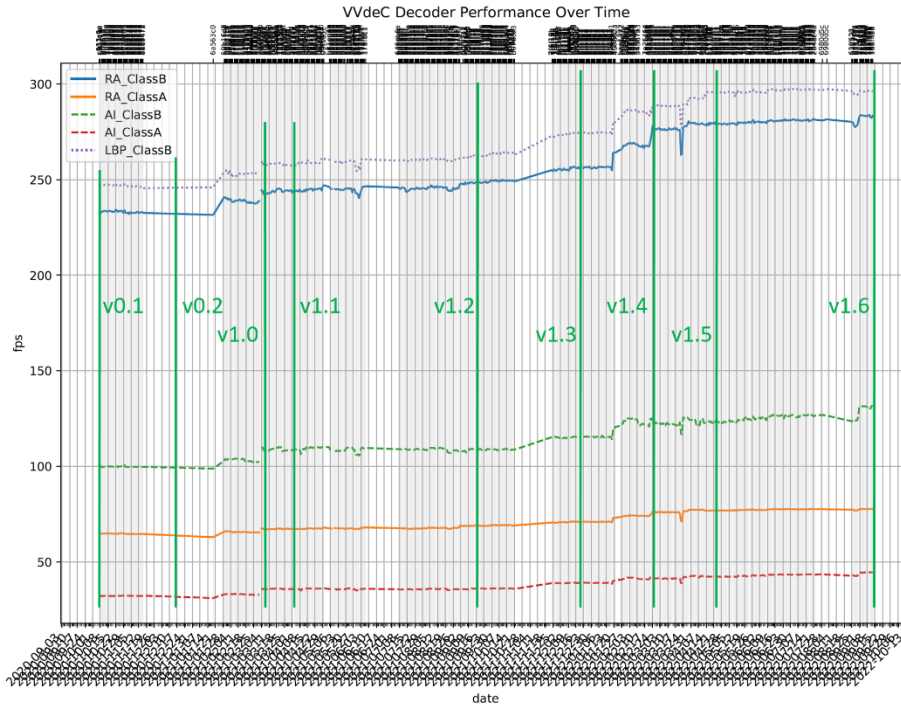

# VVdeC highlights

- Fully compliant with **Main10** profile
- **Multi-Platform**
  - Windows
  - Linux (Intel, ARM, RISC-V, ...)
  - Mac OS (Intel and ARM)
  - Android
- **Unified thread pool** from version 0.1
  - Can utilize 30+ threads
  - Independent of bitstream features
  - Today in many other decoders

# VVdeC performance since 2021

## Version history after release, through the eyes of our CI

- v1.0
- Full compliance
- v1.3
- 3x memory reduction (sic!)
- v1.4
- External SIMD contributions
- In-between
- A lot of small improvements

---

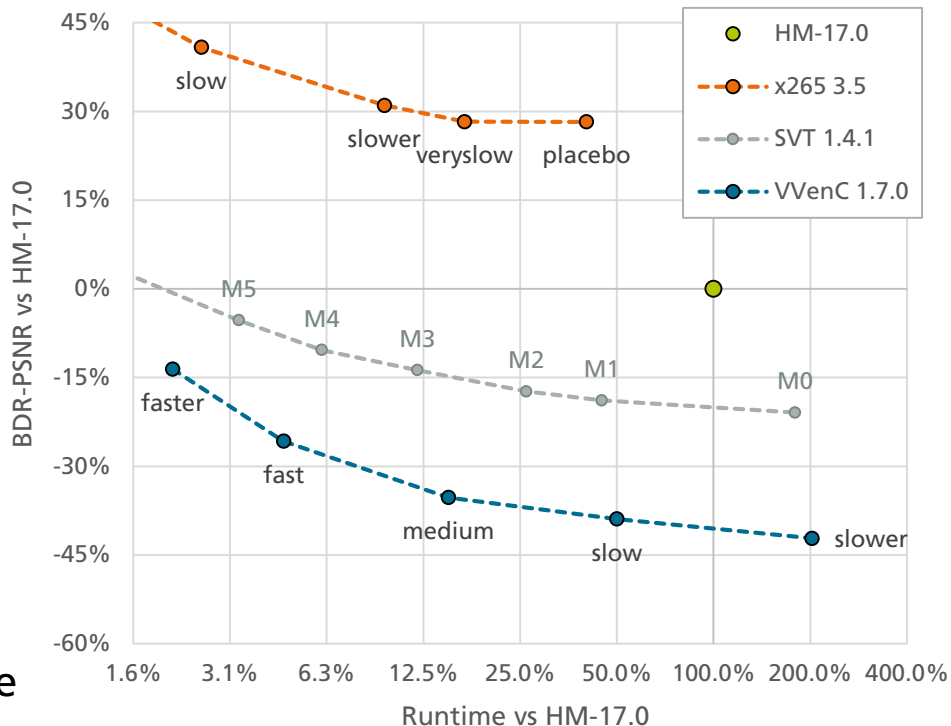

# VVenC

# VVenC highlights

- Best open-source encoder out there!
  - Optimized for VOD, offline
- Five presets
  - *faster, fast, medium, slow, slower*
- Efficient multi-threading
- Optimized for human visual system
  - Based on the XPSNR metric
- Excellent rate-control (1- and 2-pass)
- Simple interface
- Academic, amateur and commercial use

## Single threaded results (JVET HD/UHD)

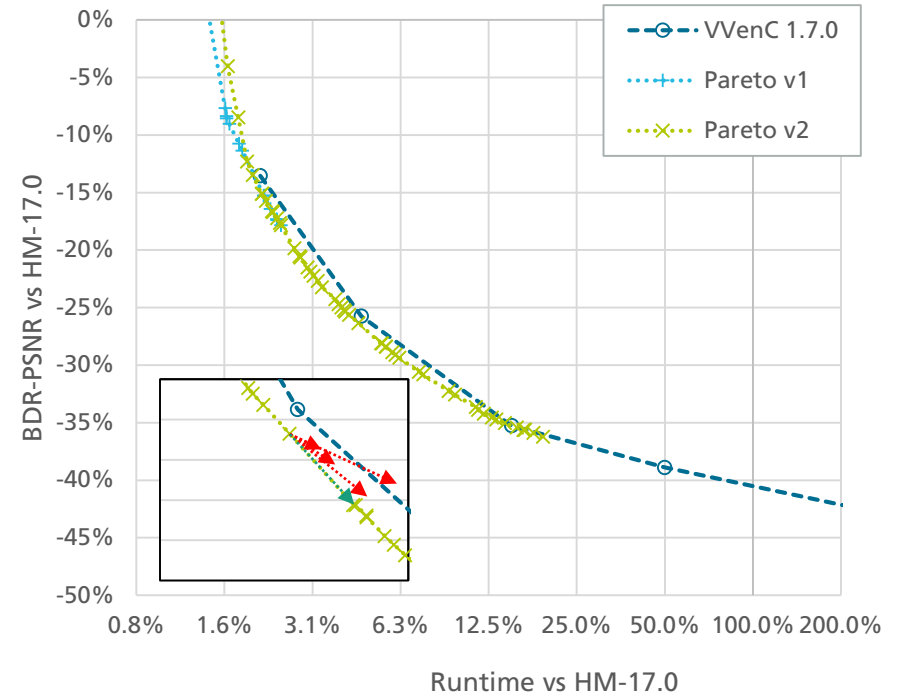

# VVenC preset derivation

## Large scale option space optimization

- All not usecase related options
- Required to put new options in place
- Repeated every 2-3 versions
  - Target: **HD, UHD** natural content
  - Sanity check for lower res, content types
- The curve still too steep
  - SW designed for readability
  - SW efficiency still **work in progress**

Brandenburg et al., MMSP, 2021.

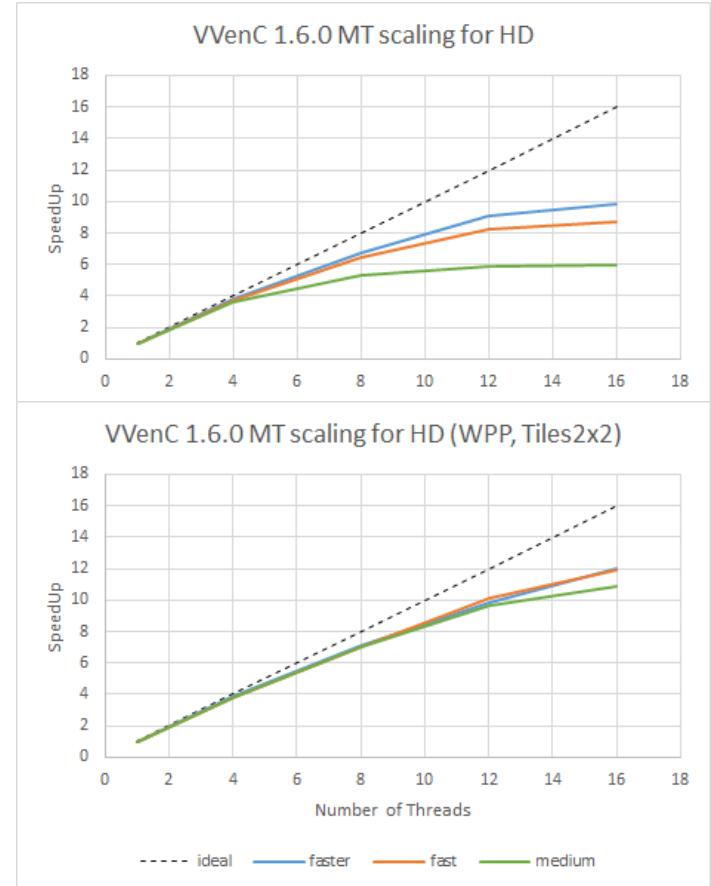

# VVenC multi-threading

## Dependency on preset, resolution, options

- Multi-threading
  - CTU- and CTU-line (simulated wavefront)
  - Independent frame parallelization
- CTU: 64 for *faster* and *fast*, 128 otherwise
  - Higher res -> more CTUs
- Better MT efficiency
  - Wavefront: no above-right dependency
  - Tiles: processed independently
  - 5% loss for *faster*, *fast*; 3% for *medium*
- Not yet ready for  $\geq 32$  threads (e.g. live)

George et. al., ISM, 2022.

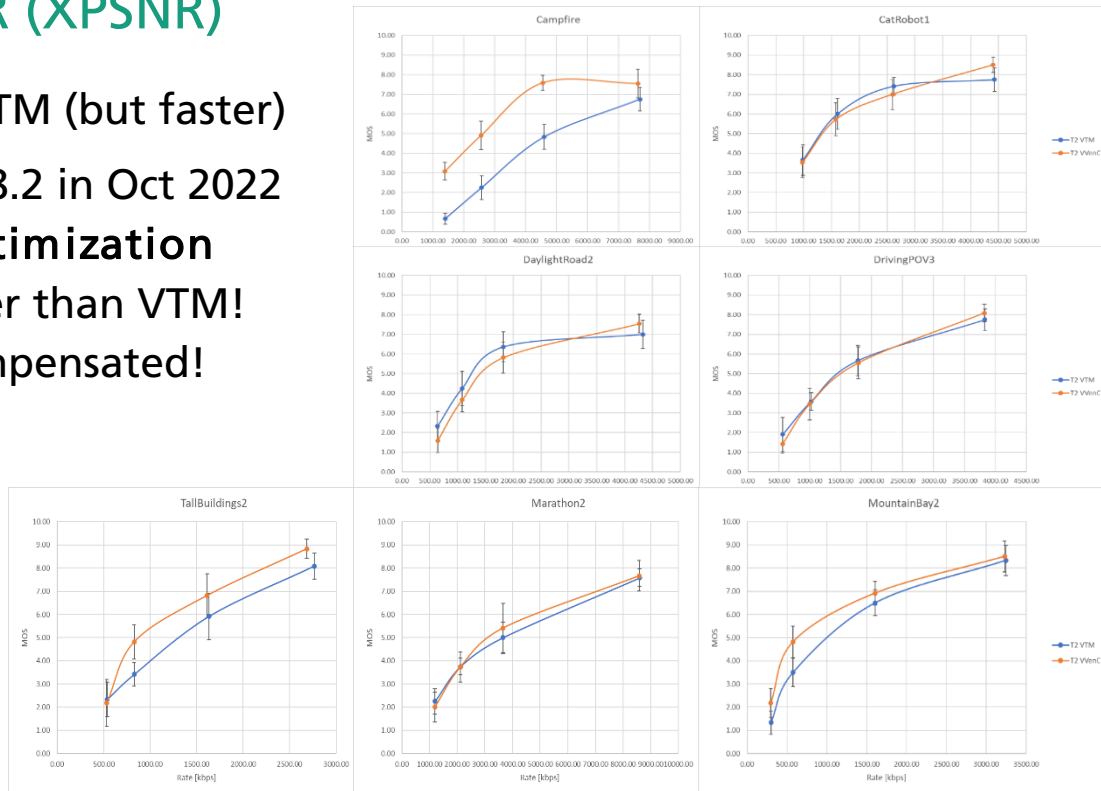

# VVenC optimization for the human visual system

## Based on the extended PSNR (XPSNR)

- VVenC *slower* comparable to VTM (but faster)
- VVenC tested alongside VTM-18.2 in Oct 2022
  - *slow*, 2pRC, with **visual optimization**
  - Results comparable or better than VTM!
  - ~5% objective BDR gap compensated!
- XPSNR

- High correlation to MOS based on multiple datasets
- Contributed to Ffmpeg

Plots: Wien et al., 2023, "JVET-AC0267".  
XPSNR: Helmrich et al., ITU Journal, 2020.

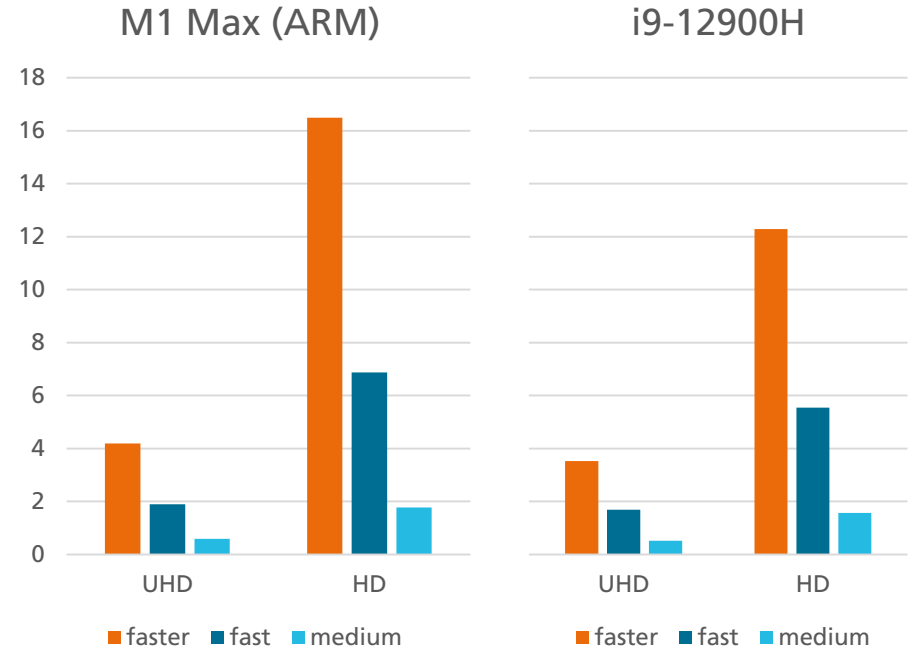

# VVenC in practice

## FPS numbers for typical mobile encodes using 8 threads

- Encodes using all-defaults
- ARM using SIMDe
  - Outperforms comparable class Intel mobile CPU
- HD encodes vs live with 8 threads
  - *faster: x4, fast: x10, medium: x30*
- UHD
  - *faster: x15, fast: x30*  
*medium: for large scale VOD*
- FPS also depends on
  - Bitrate, content, and more...

# VVenC improves with every release

## Major milestones and future

- v0.3: frame-threading
- v1.0: pure-C interface
- v1.4: scene-cut detection
- v1.5: - arbitrary intra period  
- fast-decode preset
- v1.7: ARM support
- Every version
  - Improved rate-control thanks to community feedback!
- Future: even faster and better

VVenC: multi-threaded results

---

# Ecosystem and community

# Ecosystem: how to integrate it into your workflows?

## Raw video en- and decoders only of academic interest

- **FFmpeg**: based on 3<sup>rd</sup> party patches, have a look at
  - Wieckowski et. al., ACMM, 2021. (Open-Access)  
<https://dl.acm.org/doi/10.1145/3474085.3478320>
  - Step-by-step: <https://github.com/fraunhoferhhi/vvenc/wiki/FFmpeg-Integration>
- **Playback**
  - **mpv**: link to FFmpeg with VVC
  - **VLC**: same, plus `-demux ffmpeg` (untested)
  - **ExoPlayer**: some versions are going around, ping us
  - **Web-Browser**: <https://github.com/fraunhoferhhi/vvdecWebPlayer>
- **Muxing, DASHign, etc...**
  - **GPAC**: link to FFmpeg with VVC

# Community: why and how to be part of it?

## Projects open for contribution

- Why contribute?
  - Best open source encoder out there
  - Interesting novel approach to video codecs
  - Authors retain copyright
- What to contribute?
  - Efficiency, speed-ups, improved implementation
  - Features...
- What to expect?
  - Throughout review, testing, generating results
  - Feedback and merge...

# Conclusion

# Recap of VVenC and VVdeC

## If you just entered the room...

- Open-Source implementations of VVC
- Available on GitHub under the **BSD-3-Clause-Clear** License
  - <https://github.com/fraunhoferhhi/vvenc>
  - <https://github.com/fraunhoferhhi/vvdec>
- Decoder: Enabling **playback** on **mobile** devices, laptops and PCs
- Encoder: Optimized for **VOD**, **simple**, and very **efficient**
- 3<sup>rd</sup>-party integrated into FFmpeg, and other frameworks, for simple usage
  - Upstream/alternative integrations pending
- Looking forward to **contributions, results, tests, feedback!**
